FTA JOB NUMBER 211-027

TABLE OF CONTENTS

EXECUTIVE SUMMARY

The purpose of this transportation impact study is to examine the potential traffic impact associated with a proposed Villanova University project located near the intersection of Route 30 and Ithan Avenue. The central feature of the project is a collection of undergraduate student residence hall buildings which is proposed to address presently-unmet on-campus housing demands of the existing student body. The project – and the results of this study – are summarized as follows:

- The project includes 1,135 new beds for undergraduate students, a new performing arts center (PAC), a new 1,293-space garage, and approximately 15,000 SF of Villanova-centric retail space on either side of Ithan Avenue south of Route 30, all of which is targeted to open in 2018.
- The residential component of the site will result in a reduction of peak hour traffic (since currently commuting students will now reside on campus) but to be conservative peak hour traffic associated with 1,135 currently-commuting students was left remaining in the road network and site driveways.
- The retail component of the site is estimated to generate 22 new vehicle trips during the weekday AM peak hour and 64 new vehicle trips during the weekday PM peak hour.
- The PAC will replace currently existing outdated theater / classroom space found on the north side of campus and will not result in new peak hour traffic.
- The project includes elimination of multiple driveways, consolidation of other small parking lots, and some expanded (existing) structured parking on main campus.
- Access to the project will take place via existing driveways along Route 30 and Ithan Avenue, though some will be removed, relocated, or otherwise altered in some fashion. The access modifications can be summarized as follows:
    - Between Route 320 and the Church Walk signalized intersection, eight (8) unsignalized and unrestricted driveways will be consolidated to one (1) unsignalized right-in/right-out (RIRO) driveway.
    - At the Church Walk signalized intersection along Route 30:
        - New auxiliary turn lanes along Route 30 will be provided,
        - A second exit lane will be provided, and
        - A grade-separated pedestrian bridge will be constructed.
    - At the unsignalized exit-only driveway along Route 30 just east of Ithan Avenue:
        - The driveway shall be modified to two-way operation (entry/exit),
        - A new auxiliary turn lane along Route 30 will be provided, and
        - Exiting left turns will be prohibited.
    - At the four (4) unsignalized driveways along Ithan Avenue just south of Route 30:
        - One driveway along the west side of Ithan Avenue will be eliminated,
        - The remaining driveway along the west side of Ithan Avenue will be converted to two-way operation,

- Up to three (3) driveways will be provided on the east side of Ithan Avenue though two (2) will be one-way *and* limited access (i.e., emergencies, deliveries, etc.), and
- The main garage access driveway along the east side of Ithan Avenue will be located opposite the driveway along the west side of Ithan Avenue and will be also be two-way operation.

- The measured sight distances at the proposed site driveways will satisfy all PennDOT sight distance requirements.
- F. Tavani and Associates, Inc. (FTA) recommends the following roadway improvements as outlined at key study area intersections:

Route 30 and Route 320/Kenilworth Street/Aldwyn Lane

- Optimize signal timings at the intersection during the studied peak hours in order to improve operations and queuing.

Route 30 and New RIRO Access

- Provide channelization islands to prohibit entering and exiting left turns.
- Provide new EB right-turn only lane with 75 feet of taper, 125 feet of storage, and 14 feet width.

Route 30 and Church Walk

- Optimize signal timings at the intersection during the studied peak hours in order to improve operations and queuing.
- Provide grade-separated pedestrian bridge.
- Eliminate existing pedestrian crosswalks crossing Route 30.
- Provide new EB right-turn only lane with 75 feet of taper, 125 feet of storage, and 14 feet width.
- Provide new WB left-turn only lane with 75 feet of taper, 100 feet of storage, and 10 feet width.
- Provide 11 foot wide inside and 12 foot wide outside travel lanes (10-foot travel lanes presently exist).

Route 30 and Ithan Avenue

- Optimize signal timings at the intersection during the studied peak hours in order to improve operations and queuing.
- Extend the existing EB left-turn only lane to provide a 75 feet of taper, 200 feet of storage, and 10 feet width.
- Extend the existing WB left-turn only lane to provide a full-width (10 feet) section of approximately 250 feet (between Ithan Avenue and the PAC driveway) plus an additional full-width section east of the PAC driveway measuring 100 feet with a 75-foot taper.
- Provide 11 foot wide inside and 12 foot wide outside travel lanes (10-foot travel lanes presently exist).
- Investigate reducing the existing 26-second long all-red ped-scramble phase.

Additional Site Access Points

- At the currently-existing exit-only unsignalized driveway along Route 30 just east of Ithan Avenue:
  - Modify the driveway to two-way operation (entry/exit).
  - Provide new WB left-turn only lane with 75 feet of taper, 100 feet of storage, and 10 feet width.
  - Prohibit exiting left turns.
- At the four (4) unsignalized driveways along Ithan Avenue just south of Route 30:
  - Eliminate one driveway along the west side of Ithan Avenue.
  - Relocate the remaining driveway further south along the west side of Ithan Avenue and convert to two-way operation (entry/exit).
  - Provide up to three (3) driveways on the east side of Ithan Avenue though two (2) will be limited access (i.e., emergencies, deliveries, etc.) subject to final garage design.
  - Locate the 3rd driveway will be the main garage access driveway along the east side of Ithan Avenue opposite the driveway along the west side of Ithan Avenue and provide two-way operation (entry/exit) and all-way stop-control (AWSC) with a pedestrian crosswalk connecting the garage and the resident halls.

- Level of service comparison tables were prepared in accordance with PennDOT requirements. The offered improvements, where needed, exceed the required mitigations as shown in the tables.
- Queue summary tables were prepared in accordance with PennDOT requirements. Proposed storage lengths reflect projected queues.
- Requested accident investigations reveal no correctable patterns or significant roadway design elements which should be considered.
- Additional information relative to special event parking and traffic management is being addressed by other consultants.
- The addition of a new exclusive EB right-turn lane on Lancaster Avenue at Ithan Avenue is of limited value during ordinary traffic conditions and not needed to satisfy SOL requirements. During special event conditions, its role is also likely to be insignificant since the project will result in fundamental changes to parking and circulation in the immediate vicinity of this intersection. Additional information relative to special event parking and traffic management is being addressed by other consultants.
- The intersection of Ithan Avenue and LAH/Garage Access should be designated as AWSC to benefit pedestrian mobility and garage entry/exit traffic (and related queue management).
- All other SOL-required / additional PennDOT-requested information to date (photo-documentation, pedestrian and bicycle facility descriptions, etc.) is provided.
- Levels of service (LOS) for the study area intersections have been summarized in matrix form (**Table I**) on the following pages.

Table I

For Ithan/LAH, 2023 Projected was performed twice -- once as an TWSC and once as AWSC.

INTRODUCTION

Villanova University ("Villanova") proposes construction of new undergraduate student residence halls on the site of an existing parking lot (known as "Main Lot") near the intersection of Lancaster Avenue and Ithan Avenue. Construction of the new halls will displace 1,126 existing surface parking spaces currently found on the Main Lot. The majority of replacement parking is provided in a new parking structure to be constructed east of Ithan Avenue in an area currently occupied by a surface parking lot having a capacity of 577 spaces ("Pike Lot"). The project also includes a performing art center and approximately 15,000 SF of Villanova-centric retail space, the exact users of which are to be determined. This transportation impact study was prepared per the requirements of the CICD ordinance of Radnor Township as adopted in January 2014 (Zoning 280-68.1). The ordinance features a requirement for traffic investigations pursuant to PennDOT Strike Off Letter (SOL) 470-09-4.

Traffic investigations and related due diligence with the Township and PennDOT began well before ordinance adoption. Radnor Township provided input on scope of work in mid 2012 with most data collection taking place that fall. See **Appendix A** for more details and other project correspondence. Additional efforts unfolded as ordinance deliberation continued through 2013. With the ordinance recently adopted and a conditional use hearing now underway, additional comments have been received from both PennDOT and the Township and are reflected herein.

The new student residence halls will provide a total of 1,135 new beds and are intended to address currently-unmet undergraduate student housing demand. This unmet demand results in students living off campus and commuting to classes. Construction of the new halls will result in reduced student commuting activity. Radnor Township places limits on student housing and some Villanova students live outside of the Township. Regardless of their location and the possibility of more distanced students 'backfilling' nearby student housing, the number of peak hour commuting trips will be less after the project is constructed as 1,135 currently-commuting students – near or far – will become campus-residing (non-commuting) students. The study area and the project location are shown in **Figure 1**. An excerpt of the site plan is shown in **Figure 2**.

EXISTING ROAD NETWORK

A field review of the existing roadway system in the study area was conducted. The existing roadway characteristics are summarized in Table 1. Photographs of the study area are provided in **Appendix B**.

TABLE 1

remaining streets	none	Local	N-S and E-W	25 (typical)	not available

LAND USE CONTEXT

Land use context guidance is provided in Chapter 4 of the Smart Transportation Guidebook (March 2008). The immediate area surrounding Villanova University most closely resembles the Suburban Center definition.

ROADWAY CLASSIFICATION

Roadway type guidance is provided in Chapter 5 of the Smart Transportation Guidebook (March 2008). The roadways closest to the project are Lancaster Avenue and Ithan Avenue. As summarized in **Table 1**, these roadways are defined as Regional Arterials and Neighborhood Collectors.

Applicable excerpts from the Smart Transportation Guidebook are provided in **Appendix C**.

PEDESTRIAN, MASS TRANSIT, AND BICYCLE FACILITIES

Both the Villanova campus and the roadways closest to the project provide sidewalks, painted pedestrian crosswalks, bicycle facilities, and/or designated pedestrian-only paths. There are also several mass transit opportunities in the area:

- SEPTA Regional Rail Paoli/Thorndale (formerly R5) line, north side of Route 30;
- SEPTA Norristown High Speed Line (formerly RT 100) line, south side of Route 30; and
- SEPTA Bus Routes 105 & 106 along Route 30 (stops near Ithan Avenue & Church Walk).

Additional details are provided in a figure in **Appendix D**.

EXISTING TRAFFIC VOLUMES

The site will generate traffic at various times throughout the day, though typical weekday commuter peak periods (i.e., 7:00-9:00 AM and 4:00-6:00 PM) are when the demands of the site plus existing traffic at study area intersections will be at a combined maximum. Data collection for this study was scheduled reflective of this and was performed by FTA principally in the fall of 2012 following receipt of a scope of work by the Township in June 2012.

MANUAL TURNING MOVEMENT COUNTS

Manual traffic counts were conducted using 15-minute intervals during weekday commuter peak periods (7:00-9:00 AM and 4:00-6:00 PM) at the following locations:

1) Lancaster Avenue and Spring Mill Road / Kenilworth Road / Aldwyn Lane
2) Lancaster Avenue and Church Walk
3) Lancaster Avenue and Ithan Avenue
4) Lancaster Avenue and Lowrys Lane
5) Lancaster Avenue and Garrett Avenue
6) Conestoga Road and Sproul Road
7) Conestoga Road and Spring Mill Road
8) Conestoga Road and Ithan Avenue
9) Conestoga Road and Lowrys Lane
10) Conestoga Road and Garrett Avenue
11) County Line Road and Spring Mill Road
12) County Line Road and Ithan Avenue North
13) County Line Road and Ithan Avenue South
14) County Line Road and Lowrys Lane
15) County Line Road and Airedale Road
16) County Line Road and Roberts Road
17) Ithan Avenue and Aldwyn Lane

In addition, counts were also conducted at the unsignalized driveways serving Villanova's main parking lots (Main Lot and Pike Lot) which are located on either side of Ithan Avenue south of Lancaster Avenue. These driveways were counted twice – in 2011 and in 2013.

The analyzed peak hours were 7:30 to 8:30 AM and 5:00 to 6:00. Turning movement peak hour volumes are presented in **Figures 3** and **4**. Pedestrian crossing activity was also counted and is presented in separate figures. The counts were conducted during ordinary class days.

Additional information regarding existing traffic volumes – including count data – is provided in the **Appendix E**. Note that "Special event" data collection was also conducted namely during Homecoming (10-26-12) and a weekday evening during a basketball game (St. Joes 12-11-12) and is referenced in the appendix. In all cases, the data collection efforts were also selected during normal weather and when no area road construction or detours were underway.

BASE CONDITIONS

The opening date of the project is expected to be 2018, or approximately six (6) years from the date of the data collection of the site (Fall 2012). This timeframe includes engineering, land development approvals, construction, fit out, and occupancy of the site. PennDOT

regulations require adding five (5) additional years to the full build condition to arrive at a Design Year (2023). Thus this report includes two base conditions:

- 1.51% (0.25% per year for 6 years) for Full-Build (2018), and
- 2.78% (0.25% per year for 11 years) for Design Year (2023).

BACKGROUND GROWTH

In 2013 the Delaware Valley Regional Planning Commission (DVRPC) performed studies which resulted in a recommended growth rate for the study area in Radnor Township. This TIS incorporates the recommended rate (0.25% per annum) and was approved by PennDOT. DVRPC growth rate documentation is provided in **Appendix A**.

NEARBY PROPOSED DEVELOPMENTS

At this time there are no other significant approved land development projects in the immediate vicinity of the project. The Base (No Build) scenario includes existing traffic volumes and either 6 or 11 years of compounded growth at 0.25% per year applied to all through movements (i.e., excluding driveways and dead-end streets). 2018 and 2023 Base Condition turning movement peak hour volumes are presented in **Figures 5** thru **8**.

PROJECT DESCRIPTION

The most significant component of the project is the residence halls which yield 1,135 new beds on campus. These beds will be used by existing commuting undergraduate students, many of whom currently use Main Lot. In the future, while many 'converted' campus-residing (former commuting) students will continue to own automobiles, these automobiles will – in large part – not be utilized or moving during weekday commuter peak periods. This is but one of a few fundamental changes in traffic patterns which will result from the project. Other changes include:

- added parking to existing garages (HSB and SAC) on the north side of campus,
- consolidation of several small parking lots plus added supply west of Church Walk,
- elimination of several unregulated driveways along Route 30 west of Church Walk,
- construction of a new grade-separated pedestrian bridge at Church Walk, and
- other capacity-adding and mobility-improving features.

See **Appendix F** for map figure which identifies locations of buildings and parking lots throughout campus.

Note that even though the automobiles owned by the new campus-residing students will typically not be active or moving during weekday peak periods, this TIS assumes *all* parking spaces continue to be active during peak hours, just as they are today (without the new residence halls). This adds a significant measure of conservativeness to the Projected Conditions scenarios.

TRIP GENERATION

Trip generation activity for many land uses can be investigated utilizing the Institute of Transportation Engineers' (ITE) publication entitled Trip Generation Manual and land use code 550 (University/College) is available for review. However, the data is intended to reflect entirely new universities / new students. This project provides for the conversion of

currently-commuting students to campus-residing students – not net new students – so a different approach is needed.

The project may result in a small net increase in parking. More importantly, the project includes significant shifts in the location of parking spaces as well as their function. For example, there currently exists 1,126 parking spaces in the Main Lot (west side of Ithan Avenue) and 577 spaces in Pike Lot (east side of Ithan Avenue). With the project constructed, there will be 62 parking spaces in the 'former' Main Lot and 1,293 spaces in a structure on the 'former' Pike Lot (many of which will be occupied by non-moving student-owned vehicles).

As mentioned earlier, the project continues to assume parking space activity 'turns over' in the same manner as it does today (i.e., as it does with currently-commuting students). The trip generation for the project is thus conservatively based upon the trip generating characteristics of the existing parking spaces in Main and Pike Lots and is effectively a reallocation of current peak hour activity based on the location of new parking spaces throughout campus, including at the new Pike garage, at the expanded HSB garage, at the expanded SAC garage, and at the 'new' West Lancaster surface lot (WLL). More details about trip generation rates for existing parking is provided in **Appendix G** and are summarized below.

TABLE 2
PARKING SPACE TRIP GENERATION

Trip Generation (Parking Spaces)	**AM Peak Hour**			**PM Peak Hour**		
	IN	**OUT**	**TOTAL**	**IN**	**OUT**	**TOTAL**
Rates	0.227	0.028	0.255	0.199	0.225	0.424

Note that the plans submitted with the conditional use application revealed a small net increase in parking (19 spaces) but this number is subject to further refinement as land development ensues.

In addition to this trip generation, the Township traffic engineer requested (in a letter dated 23 July 2014 as found in **Appendix A**) that the trip generation potential of the university-centric retail space be examined and discussed. This was conducted as requested and was based upon similar retail space found at St. Joe's University and is described in greater detail in **Appendix G**. In summary, the retail component of the site is estimated to generate 22 new vehicle trips during the weekday AM peak hour and 64 new vehicle trips during the weekday PM peak hour. Even though the Township traffic engineer only asked for a discussion of the potential of this traffic, the referenced trips were in fact included in the Projected Conditions of this TIS. **Table 3** summarizes the weekday AM and PM peak hour new vehicular trip generation potential of the site.

TABLE 3
TRIP GENERATION (NEW VEHICULAR TRIPS)

Trip Component	**AM Peak Hour**			**PM Peak Hour**		
	IN	**OUT**	**TOTAL**	**IN**	**OUT**	**TOTAL**
Retail	11	11	22	34	30	64
Net Parking Gain (potential)	4	1	5	4	4	8
TOTAL	15	12	27	38	34	72

TRIP DISTRIBUTION

The distribution of site traffic is essentially an extensive redistribution of existing traffic due to the reassignment of parking supply in different locations throughout the core campus area (HSB & SAC garages, WLL, etc). In addition there are proposed changes to driveway locations and functionality, such as the Lancaster Avenue inbound access to the Pike Lot garage (which currently exist but is presently exit-only). As a result, several different models were created to track traffic assignments which result from parking changes in different locations which are affected by the project. The principal parking locations affected include:

- Pike Lot (Garage),
- LAH surface parking and the West Lancaster Lot, and
- the expanded HSB/SAC Garages.

More information regarding the derivation of trip distribution models is provided in **Appendix H**. Essentially, trips are added or subtracted throughout the network proportionate to existing driveway volumes (and adjacent intersections which are sources or sinks of said volumes). Retail traffic was added along Route 30 equally in each direction as further described in the worksheets. **Appendix H** includes the results of all individual peak hour worksheet in summary figures presented at the end of the Appendix. Proposed road improvements are described later but are summarized in **Figures 9** and **10**. The combination of site traffic with Base Condition volumes yield Projected Conditions peak hour volumes, **Figures 11** thru **14**.

CAPACITY ANALYSIS METHODOLOGY

Capacity analyses were conducted for the weekday AM and PM peak hours at the study area intersections. These analyses were conducted according to the methodologies contained in the 2010 *Highway Capacity Manual* (where applicable) and using *Synchro 8* software. The following conditions were analyzed:

- 2012 Existing Conditions,
- 2018 Base Conditions,
- 2018 Projected Conditions,
- 2023 Base Conditions, and
- 2023 Projected Conditions.

In addition, capacity analyses were conducted at the proposed site driveway intersections under the Projected Condition scenarios.

Note that per chapter 10 of PennDOT's *Publication 46,* certain default values in *Synchro 8* were changed. These adjustments were made using Suburban classification data at all intersections and driveways in the study area.

PennDOT's transportation impact study guidelines outlined in Strike Off Letter 470-09-4, dated February 2009 last updated December 2013 contain the following criteria regarding levels of service:

- Page 29 of the Guidelines describes that if evaluation of the Base Condition to the Projected Condition results in an overall level of service increase greater than 10 seconds then the Applicant will be required to mitigate the impact.
- Page 31 of the Guidelines states that new driveways shall be designed to operate at LOS C in rural areas and LOS D in urban areas.

Base Condition analysis signal timings were optimized. Overall PHFs were utilized.

LEVELS OF SERVICE IN THE STUDY AREA

Levels of service (LOS) at the study area intersections for the weekday AM and PM peak hours are summarized in **Tables I** as found in the **Executive Summary**. As revealed in the tables, all levels of service at the study area intersections comply with the requirements outlined in the PennDOT SOL.

Note that at the intersection of Lancaster Avenue and Ithan Avenue, the 2023 Projected Condition was analyzed twice – once with a new exclusive EB right-turn lane added and once without said lane. Adding the lane provides a small benefit – a reduction of 1 second of delay in the AM peak hour and slightly more during the PM peak hour. However, PennDOT SOL regulations (as well as the CICD ordinance) are satisfied without the addition of the lane. The benefit of the lane during special event management will no longer be as important as it is today since both the location of parking and the management of special events are proposed to be significantly different. An exclusive EB right-turn lane also extends pedestrian crosswalk distance and for all these reasons is not recommended.

The intersection of Ithan Avenue and LAH/Garage Access was also examined twice – as an AWSC and as a TWSC intersection. The levels of service in either case are comparable but AWSC provides added benefit to pedestrian crossing / mobility and garage turning movement queue management. For these reasons, AWSC control is recommended at this location.

The large number of intersections in the study area and the complexity of the analysis – which incorporates both alternating HCM 2010 and Percentile Delay methodologies as well as alternating lane configuration / traffic control treatment at certain locations – precludes a manageable printed output of capacity worksheets. More details regarding capacity analyses are explained in **Appendix I**. The signal plans utilized in the analyses are provided in **Appendix J**.

QUEUE LENGTH ANALYSIS

Projected 95th percentile queues are available from *Synchro's* electronic files which can be produced upon request for all AM and PM peak hour investigations. In terms of requirements, PennDOT Guidelines provide direction in Strike Off Letter 470-09-4, specifically, page 27 of the Guidelines describes for both Base and Projected Conditions queue and turn lane analysis shall be conducted and provided "as appropriate".

The project primarily affects the intersections of Lancaster Avenue and Ithan Avenue and Lancaster Avenue and Church Walk as well as the proposed points of access both along Lancaster Avenue and along Ithan Avenue. Queue estimates at these locations are summarized in **Table 6**.

n/a indicates lane does not exist under base (current) conditions. + indicates proposed length = length of driveway / throat
minimum value of 25 used if returned value is <25 and >0 0 value used if prediction is 0
-- indicates through lane (or shared through lane) having no defined stacking distance or not applicable/not proposed.

TURN LANE WARRANT ANALYSIS

The project includes providing new auxiliary left- and right-turn lanes as appropriate at nearly all proposed points of access. As they are offered with the project, the warrant analysis is inconsequential. The locations where a new auxiliary left or right turn lanes are *not* proposed – and the reasons for the proposed omission – follow:

- Route 30 WLL driveway, no WB left turn lane is suggested since the movement is prohibited.
- Route 30 PAC driveway, no EB right turn lane is suggested since it is not warranted.
- Ithan Ave LAH/Garage driveways, no NB/SB right turn lanes are suggested since they are not warranted.

Evidence of the lack of need for the PAC and LAH/Garage auxiliary lanes were based on SOL 470-08-4 as well as PennDOT *Publication 46* Chapter 11 page 11-46 Turn Lane Warrants. The details of the investigations are included in **Appendix K**.

CRASH DATA INVESTIGATIONS

Crash history investigations using PennDOT-supplied cluster list, homogenous report, crash resumes, and a crash summary for 01/2008 to 12/2012 data along the Lancaster Avenue corridor (from Spring Mill Road to County Line Road) were conducted.

The study area featured 112 reportable accidents. Highlights of the data include:

- 0 accidents involved fatalities
- 6 accidents involved pedestrians
- 8 accidents involved injuries classified as *moderate* or *major*
- 24 accidents involved injuries classified *minor*
- 13 accidents involved environmental conditions such as ice- or snow-covered roadways

The segment in question covers approximately 1.23 miles and is classified as an urban, NFAC (non full-access control) roadway. The calculated crash rate (C) of the study corridor is 2.40 crashes per million vehicle miles whereas the latest Department-provided homogenous report gives a rate of 2.25 crashes per million vehicle miles for similar roadways which are undivided, are 41-99 feet wide, and which feature 10-99k ADT. The difference in crash rates (between the study area and similar roadways per the homogenous report) is not significant. It is also appropriate to eliminate certain crashes given the involvement of conditions unrelated to the design of the roadway including – but not limited to – environmental factors such as snow, ice, etc. Eliminating the 13 accidents (per the last bullet point above) which involve these conditions, for example, produces a redacted crash rate (C') of 2.12 crashes per million vehicle miles, which is lower than the homogenous report rate for similar roadways.

Whether using C or C', the crash history of the corridor is consistent with the crash history of other roadways having similar attributes. The absence of any crash involving a fatality and the relatively low number of accidents involving major injuries, moderate injuries, and pedestrians also supports this conclusion.

Note that the individual crash data for the 6 accidents involving pedestrians were reviewed and no correctable pattern or element was discovered.

Crash data is not provided in any appendix but will be kept on file should PennDOT or the township traffic engineer wish to review it.

PARKING

Parking demands have been documented throughout the entire campus under both 'ordinary class' conditions and 'special event' conditions including home basketball games. Copies of detailed campus-wide parking tabulations (including summaries of observed demand and available supply) on more than a dozen different days are summarized in **Appendix L**. As shown, there typically exist hundreds of unused parking spaces throughout campus regardless of time of day or circumstance.

West Campus has some similarities with the proposed student resident halls since it is principally occupied by undergraduate upperclassmen. The unconstrained parking demand rate at West Campus is ~55% which suggests that auto ownership at the proposed student resident halls (which may be comparable) may be significant. The number of spaces in the garage which will not be moving during weekday commuter peak periods could potentially be about 600 and possibly more. Regardless and as previously explained, *all* parking in the garage is assumed to be "peak hour moving" to provide the most conservative results.

Questions regarding midday vehicular activity by the proposed student hall residents have been raised. The likelihood that campus residing students are any more (or less) likely to make midday trips is questionable, but regardless West Campus midday parking "turnover" was examined in an attempt to quantify midday trip making. Investigations occurred on Tuesday, 30 April 2013. Traffic counts were conducted at the only driveway which is used by student residents to gain access to / from West Campus student parking areas between 10 AM to 12 PM. In addition, during the counts, a random sample of approximately 5% of the available parking spaces (30 out of 596 spaces) were monitored for turnover. The investigations determined:

- The peak hour was 11:00 AM to 12:00 PM.
- During the peak hour, 30 entering vehicles and 23 exiting vehicles (53 total trips) were recorded at the driveway.
- During the same hour, there was turnover at 2 of the 30 parking spaces which were monitored and the turnover activity at these spaces amounted to 2 arriving (entering) vehicles and 2 departing (exiting) vehicles (4 total trips).

The results suggest that midday peak hour parking turnover – and thus trip generation – is on the order of about 1 out of every 10 parking spaces during class days. This activity is much lower than AM and PM peak hour trip generation. AM peak hour trip generation is approximately 1 trip for every 4 parking spaces and PM peak hour trip generation is approximately 1 trip for every 3 parking spaces

More details on the study are provided in **Appendix L**.

SIGHT DISTANCE ANALYSIS

A sight distance analysis was prepared for the proposed site driveways. In general, recommended sight distances depend upon the posted speed limit and roadway grades. Existing sight distances were measured in accordance with PennDOT Publication 282 and compared to

PennDOT's desirable (aka tabular) and SSSD (aka formulaic) sight distance as found in Title 67 Chapter 441 of the PA Code. Comparisons with available sight distances at the proposed unsignalized site accesses are presented below. Note that the posted speed limit along both Lancaster Avenue and Ithan Avenue is 25 mph. Note also that if the available sight distance is well beyond the required minimum then the full extent of available sight distance was not documented. Grades are field estimates.

DES based on posted speed limit + 10
SSSD based on posted speed limit + 10

(1) existing wrought iron fence assumed to be removed or set back ~ 3 feet from current location.

The site plans may evolve throughout land development and these sight distances will be measured again by the site civil engineer and included with the HOP application which will later be made by the site civil engineer. Vegetation trimming/removal was considered for some locations. Finally, note that while sight distances for entering left turns, approaching same direction have been provided, they are essentially irrelevant since separate entering left-turn lanes are provided (where applicable) at all site access points.

SPECIAL EVENT TRAFFIC AND PARKING MANAGEMENT

Radnor Police Department and Villanova Public Safety are present to direct traffic and chaperone motorists (and pedestrians) during events such as basketball games, homecoming, graduation events, etc. Since either Radnor Police, Villanova Public Safety, or both are present directing traffic / controlling intersection operation at most of these events, level of service analyses cannot be modeled or conducted. In addition, total intersection volumes during special events have been demonstrated to be comparable to or less than weekday peak hour traffic, and the township traffic engineer has previously given an opinion that LOS analyses are not required, but that a special event management plan *is* necessary (see **Appendix A**). Villanova has retained Chance Management Advisors, Inc. to prepare a Special Event Management Plan for future conditions.

RECOMMENDATIONS

F. Tavani and Associates, Inc. (FTA) recommends the following roadway improvements as outlined at key study area intersections:

Route 30 and Route 320/Kenilworth Street/Aldwyn Lane

- Optimize signal timings at the intersection during the studied peak hours in order to improve operations and queuing.

Route 30 and New RIRO Access

- Provide channelization islands to prohibit entering and exiting left turns.
- Provide new EB right-turn only lane with 75 feet of taper, 125 feet of storage, and 14 feet width.

Route 30 and Church Walk

- Optimize signal timings at the intersection during the studied peak hours in order to improve operations and queuing.
- Provide grade-separated pedestrian bridge.
- Eliminate existing pedestrian crosswalks crossing Route 30.
- Provide new EB right-turn only lane with 75 feet of taper, 125 feet of storage, and 14 feet width.
- Provide new WB left-turn only lane with 75 feet of taper, 100 feet of storage, and 10 feet width.
- Provide second NB exit lane.
- Provide 11 foot wide inside and 12 foot wide outside travel lanes (10-foot travel lanes presently exist).

Route 30 and Ithan Avenue

- Optimize signal timings at the intersection during the studied peak hours in order to improve operations and queuing.
- Extend the existing EB left-turn only lane to provide a 75 feet of taper, 200 feet of storage, and 10 feet width.
- Extend the existing WB left-turn only lane to provide a full-width (10 feet) section of approximately 250 feet (between Ithan Avenue and the PAC driveway) plus an additional full-width section east of the PAC driveway measuring 100 feet with a 75-foot taper.
- Provide 11 foot wide inside and 12 foot wide outside travel lanes (10-foot travel lanes presently exist).
- Investigate reducing the existing 26-second long all-red ped-scramble phase.

Additional Site Access Points

- At the currently-existing exit-only unsignalized driveway along Route 30 just east of Ithan Avenue:
  - Modify the driveway to two-way operation (entry/exit).
  - Provide new WB left-turn only lane with 75 feet of taper, 100 feet of storage, and 10 feet width.
  - Prohibit exiting left turns.
- At the four (4) unsignalized driveways along Ithan Avenue just south of Route 30:
  - Eliminate one driveway along the west side of Ithan Avenue.
  - Relocate the remaining driveway further south along the west side of Ithan Avenue and convert to two-way operation (entry/exit).
  - Provide up to three (3) driveways on the east side of Ithan Avenue though two (2) will be limited access (i.e., emergencies, deliveries, etc.) subject to final garage design.
  - Locate the 3rd driveway will be the main garage access driveway along the east side of Ithan Avenue opposite the driveway along the west side of Ithan Avenue and provide two-way operation (entry/exit) and all-way stop-control (AWSC) with a pedestrian crosswalk connecting the garage and the resident halls.

Figures 9 and **10** provide added details.

CONCLUSIONS

Based on the results of this transportation impact study, FTA offers the following conclusions:

- The project will result in a more equitable distribution of parking – and the traffic associated therewith – as compared with present day conditions.

- The project is forecasted to generate a small amount of net new vehicular traffic. Even with conservative assumptions and trip generation estimates, fewer than 100 trips during either the AM or PM weekday peak hour are predicted.
- The project includes access points which will adequately serve the projected weekday peak hour traffic volumes associated with the project.
- Many offered traffic improvements (pedestrian bridge construction, multiple driveway closures and consolidation, etc.) are not required to mitigate the impact of the site but are provided regardless.
- Available sight distances exceed requirements.
- Crash history investigations reveal no correctable patterns or significant roadway design elements which should be considered.
- The addition of a new exclusive EB right-turn lane on Lancaster Avenue at Ithan Avenue is of limited value during ordinary traffic conditions and not needed to satisfy SOL requirements. During special event conditions, its role is also likely to be insignificant since the project will result in fundamental changes to parking and circulation in the immediate vicinity of this intersection. Additional information relative to special event parking and traffic management is being addressed by other consultants.
- The intersection of Ithan Avenue and LAH/Garage Access should be designated as AWSC to benefit pedestrian mobility and garage entry/exit traffic (and related queue management).
- All other SOL-required / additional PennDOT-requested information to date (photo-documentation, pedestrian and bicycle facility descriptions, etc.) have been provided and no other deficiencies or concerns have been identified.

Villanova University Lancaster Avenue Housing Initiative **15 October 2012**
Transportation Impact Investigations joint meeting with Radnor Township & PennDOT
Meeting Minutes revised 8 November 2012

Attendees

Name	Affiliation
Fran Hanney	PennDOT
Steve Hildebrand	Villanova University
Amy Kaminski	Radnor Township / Gilmore
Susan LaPenta	PennDOT
Officer Ray Matus	Radnor Township
Bob Morro	Villanova University
Steve Norcini	Radnor Township
Marilou Smith	Villanova University
Frank Tavani	FTA, Inc.

Discussion Points

BACKGROUND

Bob Morro started off by bringing PennDOT up to speed on the project and explained how it includes new dormitory buildings with up to approximately 1,150 beds for juniors and seniors and a new parking structure – both located on the sites of the current parking lots flanking Ithan Avenue near Lancaster Avenue. The new dorms are aimed at bringing more of the existing undergraduate population on campus, not growing the school population. Even with the new beds, some undergrads will continue to live off campus, but the new dorms will significantly reduce this number and, in turn, significantly reduce student commuting trips.

Bob explained how proposed new parking will be found in not only the new parking structure but also in a new surface lot (west of the proposed dormitory buildings), and in new levels to be built atop existing parking structures on the main campus. As the project unfolds and through its parking permit program, the University plans to implement revised parking policies which will dictate where faculty, staff, resident students, commuter students, and visitors will park.

Bob next went over the proposed new ped bridge, the rationale behind the location of same (including the SEPTA Rt. 100 station platforms, grades, and the locations of classrooms).

Finally, it should be noted that while a new performing arts center (PAC) is shown on the plans as a placeholder, it will not be part of upcoming plan submittals. The plans will focus on the new resident halls, the new parking structure and other campus parking changes, and a new pedestrian bridge.

DATA COLLECTION

Frank T. then began discussion of the meeting agenda and first commented that Villanova will include the 14 intersections mentioned in the June 2012 scope of work email as requested by the twp. Given the large

scope, Frank indicated that data collection may be spread over 2 or 3 days, to accommodate limitations of personnel and count boards. FTA may also elect not to count through volumes at certain locations to minimize personnel requirements and avoid redundancy. Collected data will reflect traffic demand as well as traffic served. Locations which are immediately adjacent to each other and do not feature significant or meaningful driveways in between are likely candidates. Gilmore (Amy K.) indicated acceptance of this approach, as long as it was properly documented and defendable.

PED SCRAMBLE PHASE

Some discussion then took place regarding the 26-second all-red ped-scramble phase at Ithan. The township indicated it thinks most residents want the ped phase duration reduced, to improve traffic flow. With the proposed pedestrian bridge, it may be possible to pursue reducing the duration of the ped phase. One possible remedy includes agreement to a post-development monitoring condition wherein ped activity (and traffic counts) will be monitored following the opening of the new pedestrian bridge, with subsequent retiming and tweaking of the signal controller performed at a later date. Villanova will be required to post escrow for the post-development analysis and possible retiming efforts (permit plan modifications and controller retiming).

SPECIAL EVENTS

Much discussion took place regarding the township-requested special event traffic counts (4 intersections). It was agreed that Homecoming (Saturday, 10/27/12) would be the targeted special event and in the event of moderate to heavy rain an alternate (a home basketball game) may be chosen instead. The counts will be conducted from 12 noon to 3:00 PM. The township has concerns regarding not only traffic but thinks an analysis and/or discussion of the logistics – including buying parking tickets in advance ($10 vs $40, to facilitate planning), better wayfinding, etc. – should be included in the traffic study.

TRIP GENERATION

Much discussion also took place regarding the trip generation approach for the project. Frank mentioned that the project will not result in an increase in peak hour traffic and in fact will capture/reduce the traffic impact of 1,150 currently-commuting students since those students will now live on campus. In addition, other proposed features/uses proposed within the new buildings – such as a bookstore, a bistro, etc. – will be targeted at serving the campus population of student, faculty, staff, and visitors and will not result in any meaningful external trip generation. In addition, any space which is vacated on the main campus (i.e., relocating the bookstore) will be 'backfilled' with offices of current faculty/staff who are currently working in basements or other undesirable locations on campus which, again, will not result in new external trip generation. Frank noted that the proposed trip generation methodology/approach will be to 'grow' traffic in the study area using trip generation rates of the existing parking lots (i.e., a trip rate per 'parking space') and applying that to the net increase in proposed new parking which will result from the project. In addition, Frank mentioned that the commuting student traffic which is currently found in the existing off-site traffic counts today cannot be removed or extracted from the road network, so it will be left. Thus, the combination of leaving those trips in the road network AND adding new traffic based on current parking trip generation activity will result in a very conservative trip generation methodology in the traffic study. This was discussed at length and consensus was reached that the approach was appropriate but should still be adequately documented in the study.

DRIVEWAYS, ACCESS, & CIRCULATION

Much discussion took place regarding a number of circulation and access issues, including neighbors' request to cul-de-sac Aldwyn Lane; the possibility of a reverse frontage road parallel to Lancaster Avenue behind existing Villanova-owned properties between the site and Route 320, conversion of Aldwyn Lane to

one-way away from the intersection of Route 320 and Route 30; a long-term study of the intersection to include possible conversion to a roundabout; conversion of existing unsignalized driveways to right-in/right-out; investigation into converting Kenilworth Road to one-way away from the intersection of Route 320 and Route 30; discussion regarding an investigation into providing additional clearance for sanitation trucks, school busses and emergency services at the rail overpass on Ithan Avenue (currently 10 ft clearance); and elimination/consolidation of certain driveways. In the end, some decisions/agreements include: that a roundabout may or may not be feasible but analysis of same will not be part of Villanova's project; that consolidation of driveways will be investigated further, that a reverse frontage road is likely not feasible due to grade challenges and SEPTA equipment, and that certain other improvements such as conversion of Aldwyn to one-way may be feasible. These issues will be investigated further by Villanova and further discussion of this topic (including a decision about which scenario will be included in the upcoming TIS' Future Build section) will be part of the staged submittals as suggested by Amy K. as mentioned below.

'CHURCH WALK' INTERSECTION

The proposed ped bridge and its relationship to the existing signalized T intersection at what is called the "Church Walk" was discussed at length. Discussion points included: the possible shifting of the driveway; permanent or temporary closure(s) of the driveway(s) serving the main lot on Ithan Avenue (and the effect of driving – or reducing – traffic at Church Walk; signal warrants; signal head visibility; providing two outbound left-turn lanes; stacking length; auxiliary lane analysis (WB left and EB right) along Route 30; and ped compliance. Regarding the last issue, the township and PennDOT expressed a desire to see implementation of whatever measures may be useful to compel peds to use the proposed ped bridge (and not cross Lancaster Avenue at grade). No definitive agreement on any of the items was reached other than a general agreement that all of the issues raised (warrants, circulation, etc.) will be carefully considered as the traffic study unfolds. More definitive steps will likely evolve as part of the staged submittal process referenced earlier and explained below.

ACCIDENT STUDY

Some discussion took place regarding the requested traffic investigations. Amy indicated the township was not interested in anything more than a standard investigation of crash data of the last 5 years and that such investigation should include reportable and non-reportable accidents. No accident diagrams need be drawn.

PARKING STUDY

Township will accept, review, and consider recent parking data collection efforts already conducted by Villanova's Public Safety officers. Frank will incorporate and explain the approach taken by the officers and include the many detailed spreadsheets in the upcoming traffic study.

OTHER DEVELOPMENTS

No other developments in the Township are close enough to – or large enough – to mandate consideration /inclusion in the study. The township accepts that Villanova's trip generation is all that needs to be included.

Finally, note that some other agreements were already reached regarding the traffic study in previous emails with the township. Specifically, in an email dated 10 October 2012, the township upheld its request for 14-intersection study area; agreed to a 4-interection special event study area; and agreed that it will accept PennDOT's methodology for level of service degradations as noted in SOL 470-09-4 in its review of the upcoming traffic study. Also, Amy K. previously suggested that Villanova consider submitting the traffic study in parts (i.e., existing conditions first, no build second, trip generation/distribution third, etc.) to

facilitate a smoother review. Steve N. stated that Frank should continue to coordinate traffic efforts with Amy and used words to the effect that “if Amy and Gilmore are satisfied with how you suggest or approach a traffic issue, then the township is satisfied”.

If any part of these minutes is believed to be inaccurate or if there are significant omissions, please contact FTA by 12 November 2012 after which time the contents of these minutes will be binding. Thank you.

RE: Villanova Lancaster Avenue Expansion Wednesday, October 10, 2012 4:16 PM

From: "Amy Kaminski" <akaminski@gilmore-assoc.com>

To: "Frank Tavani" <frank@ftavaniassociates.com>

Cc: "Zienkowski Robert" <rzienkowski@radnor.org>, "Norcini, Steve" <snorcini@radnor.org>, Kkochanski@radnor.org, "John Sartor" <JSARTOR@gilmore-assoc.com>, "Dave Leh" <DLEH@gilmore-assoc.com>, "Michael Shinton" <mshinton@gilmore-assoc.com>, "April Bauer" <abauer@gilmore-assoc.com>

Good afternoon Frank—

The Township has considered your request regarding a scope reduction and offers the following responses and direction:

As a reminder, Section 255-20.B(5)(d) indicates, "*The transportation impact study shall contain, **but not be limited to**, the following information*" (emphasis added). The term "but not be limited to" indicates that additional information may be required in addition to the scope identified in this section of the SALDO.

Discussion 1: Count Locations
Response: The number of intersections studied will remain including the previously identified 14 intersections. In addition to requiring a detailed parking analysis, the reportable and non-reportable crash records are to be included in the study for the identified intersections along with an analysis of the information.

Discussion 2: Trip Generation: The SALDO Trip Generation Rates table (255 Attachment 4) does not include all of the proposed land uses, specifically, the Performing Arts Center, Parking Garage, Student Book Store, Fitness Center, Convenience Store, Bistro, and dormitory rooms. Furthermore, many of the identified sources for 255 Attachment 4 are outdated.

As indicated in SALDO 255.20.B(5)(d)[4] "*Where the appropriate data is not available, the developer shall provide the rates and document the appropriate source. If the developer requests to use significantly different rates than those given, he shall submit the rates and the specific justification to the Planning Commission prior to submission of the transportation impact study for its approval or denial.*" Given the proposed mixed uses for the site, it will be up to the applicant to provide a discussion regarding no increase in traffic. The traffic impact study should also include a discussion regarding the anticipated redistribution of any traffic movements in and around the site and campus. At a minimum, moving the Book Store from the current location, north of Lancaster Avenue , to the proposed location south of Lancaster Avenue may alter pedestrian and vehicular traffic patterns.

In addition, the TIS should include discussions regarding the planned reuse of the vacated north campus space with information regarding the square footage and the anticipated type of use. Villanova offers public use of meeting facilities and the planned reuse of the

proposed vacated spaces will need discussed more fully in the required traffic study.

Discussion 3: LOS 'C' Requirement: The Township agrees with utilizing the methodology outlined in PennDOT Strike Off Letter (SOL 470-09-4) regarding mitigation requirements for a 10 second degradation to delay.

Discussion 4: Special Events Scope: The Township agrees with reducing the scope of study for the Special Events as follows:

1. Ithan Ave & Conestoga Road
2. Conestoga Road, Sproul Road , & Spring Mill Road
3. Sproul Road/Spring Mill Road & Lancaster Avenue
4. Ithan Ave & Lancaster Avenue

Please let me know if you require clarification of the information--

Sincerely,

Amy

Subject: Re: Villanova Lancaster Avenue Expansion

Amy, I know that you have been asked to look for a date to meet with Villanova to discuss traffic. In anticipation of that meeting, I have revisited your June email (below) as well as the SALDO and have a few comments and questions:

1) Count Locations. The SALDO language (255.20.B.5.d.3) states that "all major intersections" in a study area should be counted. Several of the 14 intersections in the June email are not major intersections. I believe the ordinance requires the following to be studied:

1. Congestoga Road, Sproul Road , & Spring Mill Road
2. Ithan Ave & Lancaster Avenue
3. Sproul Road/Spring Mill Road & Lancaster Avenue
4. Spring Mill Road & County Line Road
5. Ithan Ave & County Line
6. Ithan Ave and Aldwyn Lane

2) Trip Generation. The SALDO language (255.20.B.5.d.4) requires use of trip generation tables which are provided at the end of chapter 255. Those trip generation rates support a trip generation estimate of 0 peak hour trips for the project (since no increase in student body or instructional space is proposed). As you know, I believe the project will result in a *reduction* in peak hour traffic in the study area. Nonetheless, we have in the past and still currently suggest using non-zero trip generation based on the net increase in parking spaces which are part of the project, specifically using rates which are derived from the existing parking spaces today. We also propose "leaving" the existing traffic in the road network which is due to the currently-commuting students. I believe the combination of these two types of trips results in a very conservative estimate of site impact.

3) LOS 'C' Requirement. The SALDO language (255.20.B.5.d.6.a) requires a list of recommended improvements to achieve LOS C operation at the study area intersections. The ordinance does not clarify if this is by overall LOS, or by turning movement, or what the township will do to address underlying (existing) conditions which do not meet the ordinance. Realizing several intersections will have existing conditions which do not meet the ordinance, I suggest using PennDOT's methodology for LOS impact assessment.

There are other matters I'd like to discuss with you as well, such as how the ordinance does not appear to require accident analyses or parking studies, but these 3 issues are more urgent and need to be resolved before data collection can begin. Can you provide responses on these topics in the next week or two? Thanks.

Frank

Date: Thursday, June 14, 2012, 8:26 AM

Good morning Frank—
Radnor Township has indicated the Villanova transportation impact study should include the

following information:

The Transportation Impact Study shall follow SALDO §255.20.B.5 with the following scope extent of study area, identified intersections and studied time periods:

Extent of Study Area:

1. North – Spring Mill Road from Conestoga to County Line Road
2. East – County Line Road from N. Spring Mill Road to Roberts Road
3. South – Roberts Road from County Line Road to S. Ithan Ave
4. West – S. Ithan Ave from Roberts Road to Mill Road; Mill Road from S. Ithan Ave to Conestoga Road; Conestoga Road from Mill Road to Sproul Road

2. Intersections:

1. Lowrey's Lane & Conestoga Road
2. Garrett Ave & Conestoga Road
3. Congestoga Road, Sproul Road , & Spring Mill Road
4. Ithan Ave & Conestoga Road
5. Lowrys Lane & Lancaster Avenue
6. Ithan Ave & Lancaster Avenue
7. Garrett Ave & Lancaster Avenue
8. Roberts Road & Lancaster Avenue
9. Sproul Road/Spring Mill Road & Lancaster Avenue
10. Spring Mill Road & County Line Road
11. Ithan Ave & County Line
12. Lowrey's Lane & County Line
13. Ithan Ave and Aldwyn Lane
14. County Line Road and Airdale Road

3. Study Periods:

1. Weekday AM Peak Hour
2. Weekday PM Peak Hour
3. Major Campus event: Basketball, Graduation, Football game or other acceptable event approved by Township.

Crash Records:

1. Reportable and non-reportable crash records; 5 year history (from both PennDOT and Radnor Township Police Department
2. Locations:
    i. All approaches at Lancaster Avenue and Ithan Avenue intersection;
    ii. Lancaster Avenue from Spring Mill Road to Black Friar Road

5. Pedestrian Traffic

6. Parking Utilization:

1. Parking turnover
2. Parking duration
3. Parking occupancy

Please note Steve's comment below regarding seasonal adjustments and his suggestion that counts should be obtained in September, after school is in full session. As discussed in our meeting on April 24, 2012, the Township is interested in obtaining as much information as possible and we will assist the board in making an informed decision through our professional review services. Although the identified 14 studied intersections may appear excessive, it is important to the township that an extensive transportation analysis is inclusive of all intersections within close proximity to Villanova.
Thanks so much---
Amy

Subject: RE: Villanova traffic information

Good morning Frank,

The Township has received your transmission and will provide direction regarding the study area. As far as the data collection is concerned, you may have to wait until September to obtain meaningful counts. Seasonal adjustment factors would not be appropriate in this case.

Thank you

Stephen F. Norcini P.E.
Director of Public Works
Radnor Township

Subject: villanova traffic information

Steve,

This email is addressed to you as requested but is merely the transmission of some additional traffic information intended for Amy. One PDF file is attached. It is 30 pages. It contains the figures I handed out earlier today followed by raw count data.

As we mentioned toward the close of the meeting, we would like some direction from the township regarding our trip generation methodology as well as our study area. I should re-iterate that -- as Marilou mentioned -- the school year is in its final week this week and next weeks are final examinations, so there is very limited opportunity, if any, for additional data collection.

Finally -- and I'm embarassed to only be mentioning this now -- but one of the things that occured to me AFTER our meeting today impacts what Mr. Kochanski was discussing regarding the 1159 beds which are going to be vacated off campus if and when LAH is built. Specifically we discussed how those bedrooms/houses may be filled with other tenants who may (or may not) drive in our study area and how it would be helpful if the township could say (to residents or anyone else) that we were asked to include the impacts of *that* traffic in our study. I just realized that that in fact is exactly what we did. Specifically, we did NOT reduce the traffic along Route 30, Ithan, Aldwyn, etc. at all to reflect the 1159 students now being "on site", we **simply added more** traffic based on the parking space trip generation methodology which I explained.

We will wait to hear back from you and of course if you have any questions call or email anytime. Thx.

-Frank

Villanova University Lancaster Avenue Housing Initiative **14 November 2012**
Traffic meeting with Radnor Township **revised 27 November 2012**

Meeting Minutes

Attendees

Name	Affiliation		
Lt. Chris Flanagan	Radnor Township	Bob Morro	Villanova University
Steve Hildebrand	Villanova University	Steve Norcini	Radnor Township
Amy Kaminski	Radnor Township / Gilmore	Marilou Smith	Villanova University
Chris Kovoloski	Villanova University	Frank Tavani	FTA, Inc.
Officer Ray Matus	Radnor Township		

Discussion Points

SPECIAL EVENT COUNTS

Since our last meeting, "special event" counts took place as previously discussed and agreed. They were conducted during homecoming weekend and during the counts there was no precipitation and attendance was normal. Some discussion ensued about the possibility of doing additional counts during a home basketball game, namely one scheduled for December 5th but this issue was left unresolved (see next page, last paragraph). Also discussed was how the point of the special event exercise was mainly to determine if traffic could be better managed through improved logistics and wayfinding. Villanova is already investigating ways to do this, including assigned parking to season ticket holders (which will rotate on an annual basis to treat all holders fairly), charging a fee for the parking in the proposed structure for non-season ticket holders, and other strategies, all of which will be documented later in the traffic report. Traffic count data has not yet been plotted but will be presented to the township – along with the 'ordinary' traffic data – later in December.

OTHER CAMPUS CHANGES

Bob M. talked about changes to parking permits and locations are being considered not only for special events but also for faculty and staff during the regular school year, including the possibility of changing the roadways leading to the SAC Parking Garage from one-way to two-way.

CHURCH WALK SIGNAL

Steve N. asked about the signal at Church Walk and how signal heads visibility would be affected by the proposed pedestrian bridge. Frank explained that the bridge will be essentially centered over the existing driveway, which is currently aligned with the Church Walk, so there will be no visibility issues as the signal heads will simply be mounted on mast arms on either side of the structure.

Some lengthy discussion took place regarding a WB left-turn lane and why it may not be needed at Church Walk, but that this will be investigated during the TIS production. There was discussion that in the EB direction an exclusive right turn lane at Church Walk is not needed due to proposed right-in/right-out driveway which will be located east of Church Walk, about midway between Church Walk and Route 320. Improved

access management will be provided through the elimination of 6 driveways and the reallocation of parking which will have access to the Church Walk signal (for left turns in and out).

Some discussion ensured about pedestrian crossings at grade at this location and how to prevent that. Some peds may attempt to cross, especially others in the community who Villanova can't control (joggers, SEPTA bus riders, etc.) This will be investigated further but initial thoughts include still providing sidewalks along Route 30 at Church Walk, installing post-mounted signs that prohibit ped crossings, elimination of painted crosswalks in Route 30, possibly fencing and other controls, moving SEPTA bus stops, etc.

ALDWYN LANE

Amy K. asked about any discussion which took place with the neighbors regarding Aldwyn Lane changes. At the meeting there were many neighbors not in favor of a cul-de-sac anywhere along Aldwyn Lane. Wooded Lane residents were also concerned. Frank T. mentioned a possibility may be to make Aldwyn Lane one-way for a short segment, such as between Route 320 and Wooded Lane, and further that such one-way orientation should be away from Route 30, meaning the signal heads for Aldwyn Lane could be eliminated, thereby possibly improving levels of service.

ITHAN AVENUE

Officer Matus mentioned an EB exclusive right-turn lane at Ithan might be useful as well adding a second NB left-turn lane. He also mentioned how the SB side sidewalk on Ithan is seldom used and does not extend under the Route 100 overpass. The upcoming TIS will investigate all these possibilities, including possibly extending the existing WB exclusive left-turn lane (at Ithan). Officer Matus expressed concern about directing / controlling ped flow on the east side of Ithan (i.e., from the stadium to the existing surface lot) and how controlling that should be considered in upcoming design work for the PAC and the parking structure.

Steve N. requested Villanova perform some investigations of what would need to be done to make the Ithan Avenue underpass traversable by trash trucks and emergency vehicles. Bob M. agreed to have Nave Newell investigate this and report back later. Villanova is not committing to this improvement but will provide some preliminary engineering investigations to the township.

Frank T. and others talked about traffic control devices along Ithan south of Route 30 and how the intersection of the parking structure driveway and the apartment surface parking lot area (i.e., the driveways along Ithan Avenue nearest to the Route 100 overpass) may be all-way stop-controlled. A gate may also be installed on the driveway serving the apartment surface parking lot area. Said gate would normally be open and would be provided just in the event that cut through traffic from the structure to Route 30 (at Church Walk) needs to be regulated or discouraged during certain events.

Some discussion took place regarding Dougherty Drive, which is the small road just north of Route 30 on the west side of Ithan Avenue. This unsignalized intersection permits all turning movements since some truck deliveries have to be made from Route 30 (they can't fit under the Regional Rail bridge to the north). Part of Villanova's master plan calls for a new gate and turn around area along Dougherty Drive and this will help regulate traffic flow there. This improvement is unrelated to the apartments and is moving forward presently and should be installed early next year.

If any part of these minutes is believed to be inaccurate or if there are significant omissions, please contact FTA by 30 November 2012 after which time the contents of these minutes will be binding. *Note that subsequent to the meeting, Villanova authorized FTA to move forward with additional data collection on a date TBD.*

File No. 11-04054T

Mr. Steve Norcini, P.E.
Public Works Director
Radnor Township
301 Iven Avenue
Wayne, PA 19087

Reference: Villanova University – Lancaster Avenue Redevelopment Traffic Study
Review of Deliverable #1:
Data Collection, Existing Traffic Volumes, and Initial LOS Analysis
Radnor Township, Delaware County, PA

Dear Mr. Norcini:

Gilmore & Associates, Inc. has completed the review of the referenced materials (*Villanova Traffic Study Deliverable #1*), dated: January 15, 2013, prepared for Villanova University; prepared by F. Tavani and Associates, Inc. and offers the following comments for your consideration:

BACKGROUND

The applicant, Villanova University, intends to develop/redevelop several parcels located along Lancaster Avenue, southeast and southwest of Ithan Avenue, in Radnor Township, Delaware County. The project will include the construction of student housing, retail shops, a performing arts center along with a multilevel parking structure. In addition, Villanova University intends to eliminate many of the existing driveway accesses to Villanova buildings, located south of Lancaster Avenue, and construct a shared surface parking facility to the rear of the existing university buildings with a combined shared access at "Church Walk". As such, the University is required to provide a traffic impact study for the existing, proposed, and future conditions of the roadway infrastructure. In order to expedite the review process, the applicant has agreed to provide Radnor Township and Pennsylvania Department of Transportation (PennDOT) the traffic impact study in a segmented approach to eliminate future tedious revisions.

All the below comments do not require a response or a resubmission of *Deliverable #1*; however, omissions should be addressed in subsequent submissions and in the final Report:

SUMMARY

TRAFFIC COUNT LOCATIONS:

Vehicle turning movement counts were obtained at the below requested intersections:

1. Lancaster Avenue and Spring Mill Road / Kenilworth Road / Aldwyn Lane
2. Lancaster Avenue and Church Walk
3. Lancaster Avenue and Ithan Avenue
4. Lancaster Avenue and Lowrys Lane
5. Lancaster Avenue and Garrett Avenue
6. Conestoga Road and Sproul Road
7. Conestoga Road and Spring Mill Road
8. Conestoga Road and Ithan Avenue
9. Conestoga Road and Lowrys Lane
10. Conestoga Road and Garrett Avenue
11. County Line Road and Spring Mill Road
12. County Line Road and Ithan Avenue North
13. County Line Road and Ithan Avenue South
14. County Line Road and Lowrys Lane
15. County Line Road and Airedale Road
16. County Line Road and Roberts Road
17. Ithan Avenue and Aldwyn Lane

In addition to the above intersections, turning movement counts were conducted at the five unsignalized driveways serving Villanova's main parking lots along Ithan Avenue and Lancaster Avenue, for a total of twenty-two (22) count locations.

COUNT PERIODS:

1. Morning Peak Hour (AM) 7:00 AM – 9:00 AM
2. Afternoon/Evening Peak Hour (PM) 4:00 PM – 6:00 PM
3. Requested Special Event No. 1: Homecoming Traffic (October 27, 2012) Noon-3:00 PM
4. Requested Special Event No. 2: Basketball Traffic (December 11, 2012) 6:00 PM-8:00 PM

COMMENTS:

1. **Special Event Analyses**: Included in the *Deliverable #1* submission was a discussion regarding the comparison of the AM and PM peak hour data with the "Special Event" peak hour data. The discussion concluded there is no real value in developing a level of service analysis for the "Special Events" because the total intersection volumes during "Special Events" were less than both the AM and PM Peak hours studied. While we do agree with this conclusion and support eliminating the unnecessary level of service analysis for the two "Special Events", we remind the applicant that a Special Event Traffic Plan is required in the final submission, as discussed during recent scoping meetings.

2. **Adjustments: Traffic Demand versus Traffic Served:** It appears that no volumetric adjustments were made to any of the studied intersections concerning the observation of unmet demand. Evidently, the only approach exhibiting excessive queues from unserved vehicles occurred on the southbound approach of E. County Line Road at Airdale Road. Information provided in *Deliverable #1* indicates that an excess of five (5) vehicles were observed during both the AM and PM peak 15 minutes analyzed.

Although the explanation provided regarding the unserved demand volumes indicated the queues were directly related to the metering effect from the adjacent signalized intersection, no adjustment to the analysis data was included. An adjustment should be made to the traffic volumes, or further discussion regarding the excessive queue on the southbound approach of E. County Line Road at Airdale Road should be included in the final report. The discussion should include a more detailed explanation of causal factors rather than an general discussion.

3. We remind the applicant of the following information as indicated in Strike-off Letter (SOL) 470-09-04, *Policies and Procedures Transportation Impact Guidelines,* Dated: February 12, 2009

    a. Page 8: PennDOT requires a five (5) year projection beyond the anticipated full build-out of the proposed site.
    b. Page 13: Crash records shall be provided along with a crash pattern discussion.
    c. Page 15: A detailed level-of-service and delay table by approach and movement for the various studied scenarios shall be provided.

GENERAL:

4. For verification, the Synchro Reports should include the detector layouts in the report. It appears the detector option was not selected when generating the report. Please include in future submissions.

5. Unsignalized intersection capacity analysis must be provided through Report selection for HCM Unsignalized Intersection Capacity Analysis. The provided Report did not identify LOS or Delay for the unsignalized intersections.

6. PennDOT File No. 0779 *Lancaster Avenue & Villanova Parking Lot* was not included in this submission; please include the Signal Permit Plan in subsequent submissions.

INTERSECTION:

7. Pages 3 and 62 of 208: AM & PM Synchro data for Intersection 3: *County Line Road & Spring Mill Road*:
    a. Verify posted speed limit on both approaches of Spring Mill Road; it appears the speed limit is 25 MPH.
    b. Per the Signal Permit Plan, revise the OFFSET to “0” for both AM and PM timings
    c. AM timing should reflect a total of 20 seconds for phase 2+6 (Spring Mill Road) and 40 seconds for phase 4+8 (County Line Road) for a total Cycle Length of 60 seconds.
    d. PM timing should reflect a total of 22 seconds for phase 2+6 (Spring Mill Road) and 38 seconds for phase 4+8 (County Line Road) for a total Cycle Length of 60 seconds.

8. Page 31 and 67 of 208: AM and PM Synchro data for Intersection 7: *Sproul Rd/Spring Mill Rd & Aldwyn Ln/Kenilworth Rd & Lancaster Ave* and PennDOT System Plan I-0156: revise the control type to FREE operation.

9. Pages 37 and 73 of 208: AM & PM Synchro data for Intersection 16: *Conestoga Road & Sproul Road* and PennDOT File No. 0886.
    a. Verify this intersection is the MASTER intersection and Offset = 0; the permit plan does not identify the offset or typical coordination notes regarding the system limits.
    b. Verify the Minimum Initial for Phases 4+8 and 2+6; it appears the values may have been transposed.

10. Pages 42 and 78 of 208: AM and PM Synchro data for Synchro Intersection 27: *Lancaster Avenue & Ithan Avenue* and PennDOT File 0780:
    a. Minimum Initial for Phase 2+6 should be verified; the signal permit plan indicates a value of 34.0 seconds for the minimum initial.

11. Page 47 and 83 of 208: AM & PM Synchro data for Intersection 33 *Williams Rd/Garrett Ave & Conestoga Rd*; verify the posted speed limit and lane widths on all approaches to this intersection. It appears Williams Road/Garrett Avenue is posted at 15 MPH and Conestoga Road is posted at 25 MPH; and the lane width default value of 12 feet was utilized.

12. Pages 52 of 208: AM Synchro data for Intersection 51: *Lowrys Lane & Lancaster Avenue* and System Plan I-0156: Revise the offset to 25 as indicated on the System Plan

13. Page 82 of 208: PM Synchro data for Intersection 29: *Strathmore Dr/Lowrys Ln & Conestoga Rd*; verify the turning movement counts for the northbound approach; both the count data and figures indicate 15, 8, 17 for the left, through and right movements.

As indicated previously, none of the above comments require a response or a resubmission of *Deliverable #1*; however, we recommend the applicant resolve identified omissions/corrections in subsequent submissions and in the final Report. We hope you find the above discussion useful and, please do not hesitate to contact this office if the Township has any questions.

Sincerely,

Amy B. Kaminski

April 24, 2013

File No. 11-04054T

Mr. Steve Norcini, P.E.
Public Works Director
Radnor Township
301 Iven Avenue
Wayne, PA 19087

Reference: Villanova University – Lancaster Avenue Redevelopment Traffic Study
Review of Deliverable #2:
Parking Supply & Demand, Trip Generation, Trip Distribution, Trip Redistribution
Radnor Township, Delaware County, PA

Dear Mr. Norcini:

Gilmore & Associates, Inc. has completed the review of the referenced materials (*Villanova Traffic Study Deliverable #2*), dated: February 21, 2013, prepared for Villanova University; prepared by F. Tavani and Associates, Inc. and offers the following comments for your consideration:

BACKGROUND

The applicant, Villanova University, intends to develop/redevelop several parcels located along Lancaster Avenue, southeast and southwest of Ithan Avenue intersection, in Radnor Township, Delaware County. The project includes construction of student housing (1,159 bed apartment-style residence halls), retail shops (University Bookstore, bistro and small convenience store) to be located on the southwest corner of Lancaster Avenue and Ithan Avenue. In addition, the project includes construction of a Performing Arts Center (with 500 – 650 total seats in two theaters) and multilevel parking structure to be located on the southeast corner of Lancaster Avenue and Ithan Avenue. Villanova University intends to eliminate many of the existing driveway accesses located on the south side of Lancaster Avenue, west of Ithan Avenue and construct a shared surface parking facility to the rear of the existing university buildings with limited access to Lancaster Avenue at the signalized intersection of Chapel Walk. Villanova University is required to provide a traffic impact study to both Pennsylvania Department of Transportation (PennDOT) and Radnor Township for the existing, proposed, and future conditions of the roadway infrastructure. In order to expedite the review process, the applicant has agreed to provide Radnor Township and PennDOT with the traffic impact study in a segmented approach to eliminate future extensive reviews and revisions. This submission represents the second deliverable provided to both PennDOT and Radnor Township and examines the following information:

1. Parking Supply and Demand
2. Trip Generation
3. Trip Distribution (new traffic)
4. Trip Re-Distribution (existing traffic)

All of the below comments do not require a response or resubmission of *Deliverable #2*; however, comments should be addressed in subsequent submissions and in the final Traffic Impact Study analysis:

COMMENTS:

DELIVERABLE #1

1. *Deliverable #1:* While reviewing *Deliverable #2,* the Synchro® files from *Deliverable #1* were submitted for review and revealed the AM and PM networks include many bends in the roadway coding. Bends are typically used for lane adds or drops in a roadway network. Synchro cautions users to use curved links instead of bends where possible. We recommend eliminating the short link bends entirely for bends number 39 and 63, and revise other bends to curved links.

PARKING DISCUSSION:

1. Given the length of *Deliverable #2*, many of the following discussion points are intended to provide a summary and discussion of *Deliverable #2* to clarify the content.

2. **Parking Demand at On-Campus Residence Halls:** *Deliverable #2* information concludes that Villanova on-campus residential hall students tend to remain parked during the school day; however, provided data does not analyze parking turnover information that might provide insight as to the movement of vehicles. The table provided on page 20 of *Deliverable #2*, indicates West and South Campus parking facilities have minimal difference in the number of available parking spaces during the 10:00 AM and 12:00 PM data collection periods but does not include the parking turnover rate.

   Comment: We recommend a parking turnover analysis during the school day for West Campus to support the applicant's conclusion that parking turnover is minimal at the West Campus residential halls. The scope of work should be cleared with township staff prior to conducting the turnover analysis.

3. **Class Day Demand v. Special Event Demand:** *Deliverable #2* included information regarding a campus wide parking inventory obtained on typical class days and during several Special Events (basketball games). The information provided indicates that the typical class day parking demand is more intense than the basketball events; therefore, the focus of the parking analysis should be for a typical class day.

Comment: Based on the provided information, we agree with this conclusion and support eliminating the "Special Event" parking analysis. However, we remind the applicant that a Special Event Traffic Plan is required in the final submission, as discussed during recent scoping meetings and as a comment provided on *Deliverable #1*.

4. **Performing Arts Center:** *Deliverable #2* includes a discussion regarding parking supply and demand for the proposed Performing Arts Center. Presently, a performance stage/theater facility currently operates on campus at Vasey Hall. The existing theatre includes 167 seats and offers twelve performances per year. The new facility will include 350 – 450 seats in the main auditorium with an additional 150 - 200 seats in the "black box" theater. Discussions in *Deliverable #2* centered on the scheduling of performances to avoid conflicts with other campus Special Events like basketball games.

   Comment: The applicant concludes the events associated with the Performing Arts Center would occur in the evening, during non-peak traffic conditions when parking supply was readily available. We agree with this information and conclusion.

5. **Institute of Transportation Engineers (ITE) Parking Generation, 4th Edition:** Based on the industry standard for determining parking demand by land use type in a Suburban environment, along with the existing school population independent variable (students, faculty and staff), the Weekday Peak Period parking demand for Villanova University is calculated at 4,126 parking spaces. Data collected by Villanova indicates the peak parking demand is 4,382 parking spaces, which indicates 256 additional parking spaces are required (demand) for Villanova's campus as compared to other University Campuses of similar size and environment. The actual number of on-campus parking spaces supplied is 5,130, which exceeds the existing demand based on the school population at Villanova. Note: ITE provides parking rates based on both Urban and Suburban environments; however, the more conservative analysis used in the deliverable focused on the more intensely parked Suburban environments.

   Comment: We agree with this methodology.

6. **West Campus Housing Discussion:**
   a. The existing West Campus apartment-type residence halls have 1,244 beds and provide housing for undergraduate upperclassmen, which is similar to what is being proposed at the Lancaster Avenue Housing (LAH). A statement is included in *Deliverable # 2* indicating that it is unlikely vehicles will be moving during the peak periods on class days. The table provided on page 20 *Villanova Parking Lot Inventory* indicates minimal change in parking occupancy during the data collection periods (10AM and 12PM); however, it is unclear if the 10AM occupied/unoccupied spaces were consistent with the 12PM data or if a turnover occurred between 10AM and 12PM. Villanova has consistently maintained the construction of the LAH will reduce vehicular traffic, as off-campus students will now reside on-campus and vehicles will not be utilized during the typical class day.

Comment: We recommend a parking turnover analysis during the school day for West Campus to support the applicant's conclusion that parking turnover is minimal at the West Campus residential halls. The scope of work should be cleared with township staff prior to conducting the turnover analysis.

b. Details of the West Campus residential occupation indicate that only 1,097 of the total 1,244 beds are occupied by undergraduate juniors. Villanova has indicated that housing demand exceeds housing supply; however, the provided information indicates 147 beds are presently unused.

Comment: More detail should be provided to clarify the unoccupied beds.

c. *Deliverable #2* includes an analysis that equates the forecasted parking demand for the Proposed LAH based on the parking demand at the existing West Campus residence hall.

Comment: The analysis follows a valid methodology for projecting the number of student parking demand for the proposed LAH; we agree with this validation methodology and subsequent analysis

i. Based on the provided information that assumes the retail portion of the LAH is restricted to only Villanova University "traffic", the projected parking demand would be 550 parking spaces to be utilized by staff, visitor's and vehicular student commuters. As a comparison, the existing Pike Surface Lot provides 577 parking spaces for staff and students.

Comment: We concur that the identified 550 Pike Garage parking spaces would satisfy the existing parking demand currently provided by the Pike Surface Lot.

ii. Figure 7 indicates the net increase/decrease of parking spaces by quadrant for the proposed Lancaster Expansion. The net results indicate an increase of 653 parking spaces at the proposed Pike Garage, to be located on the southeast corner of Lancaster Avenue and Ithan Avenue. *Deliverable # 2* identifies 930 spaces will be utilized by vehicles that are not likely to be driven during the AM and PM peak hours and 300 of the remaining spaces will be utilized by Villanova staff, visitors and others.

Comment: The pedestrian traffic from the 300 parking spaces may require the signalized intersection at Lancaster Avenue and Ithan Avenue continue to operate with a protected pedestrian phase (pedestrian scramble phase) and will continue to create delays to Lancaster Avenue through motorists.

TRIP GENERATION

1. In general, when a new development is proposed, the vehicular trips associated with the new land development are calculated based on the type of land use and the size of the proposed land use. The applicant indicates there will be no net increase in traffic for the proposed University Student Bookstore, Bistro and the small convenience store. While we agree that it is very likely the University Student Bookstore will generate fewer trips than predicted by the industry standard, *ITE Trip Generation*, it is unclear how many new trips will be generated.

   Comment: As a comparison and for information purposes, the final report should include the total potential trip generation based on the square footage of the proposed Bookstore, Bistro, and convenience store in an effort to determine what the maximum number of vehicle trips generated for the development would be if the development were constructed elsewhere in the Township.

2. *Deliverable #2* indicates the Trip Generation portion of the study will take a conservative approach, analyzing the roadways and intersections to include the existing Villanova commuters that will no longer commute to campus because the students will utilize the new on-campus housing. In other words, the report acknowledges that off-campus housing vacated by Villanova students moving to on-campus housing will likely be rented by new tenants who may or may not be Villanova commuters. As such, the existing trips associated with the off-campus rental units will be included in the "background" traffic volumes and no attempt will be made to eliminate the Villanova commuters from the traffic counts obtained by the applicant.

   Comment: The conservative approach taken by the applicant dismisses taking a "credit" for traffic volumes associated with students that no longer commute to Villanova and provides a future analysis that is in all probability more intense than the existing conditions. We acknowledge and agree with this conservative approach.

TRIP DISTRIBUTION

3. *Deliverable #2* assumes the following operations and intersection traffic control:

   a. <u>Western Lancaster Avenue Housing (LAH) Lot Driveway</u>: Right-in, right-out, left-in turning movements permitted (left turning movement out of the driveway will be prohibited) and stop control for motorists exiting the driveway to access Lancaster Avenue.

      COMMENT: Previous discussions with the applicant indicated this driveway would include a right-in, right-out operation and no left turns would be permitted at the driveway intersection. If the applicant intends to include lefts into the site, a dedicated left turn lane would be necessary to reduce delay for motorists traveling westbound on Lancaster Avenue.

   b. <u>Ithan Avenue & Pike Garage North Driveway</u>: This driveway would operate as an exit only; left and right turns with stop control for the driveway.

COMMENT: We recommend altering this exit driveway to a channelized right turn and eliminating the left turn movement at the north driveway for the following reasons:

i. Left turning vehicles continuing south on Ithan Avenue would increase the delay to vehicles on the southbound approach of Ithan Avenue at the proposed all-way stop control at the Pike Garage South Driveway.
ii. Vehicles queued on northbound Ithan Avenue at Lancaster Avenue may extend beyond the Pike Garage North Driveway which increases the potential for crash incidents with southbound Ithan Avenue vehicular traffic.
iii. Eliminating left turns from the north driveway may eliminate the need for police control at the north driveway during Special Events.

c. Ithan Avenue & Lancaster Avenue Lot/Pike Garage South Driveway: Full access (all turning movements provided for all approaches) and an all-way stop control.

COMMENT: The final TIS should include detailed information regarding queue and delay for this all-way stop control; in addition, a signal warrant analysis should be included in future studies. We recognize the intersection location is a less than desirable distance from the signal at Ithan Avenue and Lancaster Avenue; however, a warrant analysis would determine if a signal might be considered at this intersection.

d. Lancaster Avenue and Pike Garage Eastern Driveway: This driveway would include left and right turns into Pike Garage, and right turns out of the driveway to continue eastbound on Lancaster Avenue.

COMMENT: Township staff has expressed concern for pedestrians using the existing de facto mid-block pedestrian crossing on Lancaster Avenue near the Villanova Stadium. Although the proposed Pike Garage Eastern driveway access provides an efficient operation for vehicular traffic, the Township may want to consider eliminating the driveway from the proposed plan or require design measures that permanently deter pedestrians crossing Lancaster Avenue east of Ithan Avenue.

4. **Pike Parking Garage Location** Although perhaps premature as this is a land development comment, we recommend the Township consider having the applicant investigate altering the location of the Pike Garage to a more campus neutral site near the proposed pedestrian bridge. Moving the parking structure to a central campus location, adjacent to the pedestrian bridge would:

a. encourage much of the pedestrian traffic to utilize the pedestrian bridge, which would reduce the number of pedestrians crossing at Lancaster Avenue and Ithan Avenue. This could provide an opportunity to eliminate the pedestrian scramble; however, adequate signage would be necessary to alert pedestrians to the new pedestrian phasing.

b. reduce the number of driveway curb cuts on Ithan Avenue and Lancaster Avenue as most vehicle traffic would take direct access to Lancaster Avenue via the traffic signal near Church Walk

c. provide a more concentrated Police detail/effort during Villanova Special Events on Lancaster Avenue near Church Walk and could potentially reduce or eliminate the need for police detail along Ithan Avenue at Lancaster Avenue near the stadium

d. concentrate vehicle turning movements at the signalized intersection on Lancaster Avenue/Church Walk without conflicting with street level pedestrian traffic.

As indicated previously, none of the above comments elicits a response or a resubmission of *Deliverable #2*; however, we recommend the applicant resolve identified omissions/corrections in subsequent submissions and in the final Report. We hope you find the above discussion useful; please do not hesitate to contact this office if the Township has any questions.

Sincerely,

Amy B. Kaminski

King of Prussia, PA 19406

RE: US 30 Radnor Township Corridor Study.

Dear Mr. Hanney:

DVRPC was asked to provide an annual background traffic growth factor to support the evaluation of alternatives to improve congestion along US 30 in the vicinity of Villanova University during peak periods. We suggest that you use an average annual factor of 0.25 percent per year between the 2012 base year and the 2035 horizon year.

This factor is based on an examination of current and forecast traffic volumes, as well as historical trends in traffic volumes and DVRPC's Board-adopted population and employment forecasts in the study area. DVRPC's new traffic demand model (TIM2.0), which was just recently validated against base year conditions, was used to support this analysis. If you have any questions or need additional information, please contact me at (215) 238-2911 or mgates@dvrpc.org.

Sincerely,

Matthew T. Gates
Manager, Office of Modeling and Analysis

Reference: Villanova University – Lancaster Avenue Redevelopment
CICD Conditional Use Transportation Review #1-*Revised*
Radnor Township, Delaware County, PA

Dear Mr. Bolla:

Gilmore & Associates, Inc. has completed the conditional use Transportation review of the submitted materials and offers the following comments for Radnor Township consideration:

I. BACKGROUND

The applicant, Villanova University, intends to develop/redevelop several parcels located along Lancaster Avenue, southeast and southwest of Ithan Avenue intersection, in Radnor Township, Delaware County. The project includes construction of student housing (1,159 bed apartment-style residence halls), retail shops (University Bookstore, bistro and small convenience store) along with 147 surface parking spaces to be located on the southwest corner of Lancaster Avenue and Ithan Avenue. In addition, the project includes construction of a Performing Arts Center (with 500 – 650 total seats in two theaters) and multilevel parking structure (1,265 spaces) to be located on the southeast corner of Lancaster Avenue and Ithan Avenue. Villanova University intends to eliminate many of the existing driveway accesses located on the south side of Lancaster Avenue, west of Ithan Avenue and construct a shared surface parking facility to the rear of the existing university buildings with limited access to Lancaster Avenue at the signalized intersection of Chapel Walk.

II. DOCUMENTS SUBMITTED

The following documents were submitted to Gilmore & Associates for review:

A. Conditional use plan set (11 sheets) for Villanova University prepared by Voith & Mactavish Architects, LLP and Robert A.M. Stern Architects, LLP, dated May 2, 2014.

65 E. Butler Avenue | Suite 100 | New Britain, PA 18901
Phone: 215-345-4330 | Fax: 215-345-8606

www.gilmore-assoc.com

B. Landscape plans (3 sheets) for Villanova University prepared by Voith & Mactavish Architects, LLP and Robert A.M. Stern Architects, LLP, dated May 2, 2014.

C. Transportation Impact Assessment for Villanova University Lancaster Avenue Student Resident Halls, prepared by F. Tavani and Associates, Inc. dated May 4, 2014.

D. Development Impact Statement for the Villanova University CICD Development dated May 2, 2014.

III. IMPROVEMENTS

According to the submitted Transportation Impact Assessment, Villanova University proposes the following improvements/accesses:

A. Lancaster Avenue at Church Walk-Signalized Intersection

1. Left and right turn lane exit from Chapel Walk to Lancaster Avenue.
2. Improvements on Lancaster Avenue at Church Walk include:
    a. Right in/right out on the eastbound approach of Lancaster Avenue, east of Church Walk
    b. A westbound dedicated left-turn lane entering Church Walk
    c. An Eastbound dedicated right-turn lane entering Church Walk
3. Full access on Ithan Avenue at Pike Lot Parking Garage
4. New pedestrian bridge spanning Lancaster Avenue at Church Walk.
5. Elimination of eight (8) existing full access driveways along Lancaster Avenue
6. Consolidation of existing parking lots with access to existing signalized intersection at Lancaster Avenue and Church Walk.

B. Pike Lot Parking Garage Accesses (Southeast corner of Lancaster Avenue and Ithan Avenue)

1. Left/right in and right out access on Lancaster Avenue, east of Ithan Avenue.
2. Full access to Ithan Avenue with northbound and southbound left-turn lanes on Ithan Avenue.
3. Right out, north of the full access to Ithan Avenue

C. Lancaster Avenue and Ithan Avenue-Signalized Intersection:

1. Lancaster Avenue eastbound dedicated left lane, one through lane and one shared through/right turn lane.
2. Lancaster Avenue westbound: extended dedicated left turn lane, one through lane and one shared through/right turn lane.
3. Ithan Avenue northbound: extended dedicated left turn lane; one shared through/right turn lane.
4. Ithan Avenue southbound: dedicated left turn lane; one shared through/right turn lane.

5. New entering left-turn movement directly from westbound Lancaster Avenue to Pike Garage including eastbound Lancaster Avenue right in/right out (prohibit left turn movement out of Pike Garage onto Lancaster Avenue.

IV. COMMENTS

A. Conditional Use Plans

1. §280-135F(1); Truck turning templates should be provided to ensure access is adequate for the "Mechanical/Loading Pit" located just west of Lancaster Avenue & Ithan Avenue. In addition, a mechanical gate is needed for this location during non-use to discourage illegal parking.

2. The conditional use plans and the TIA should provide consistent lane configurations. The TIA indicates one shared northbound lane for the Church Walk Access approach driveway while the plans indicate a left-turn lane and a shared left/right turn lane. At the intersection of Ithan Avenue and Lancaster Avenue, the TIA indicates a dedicated right turn lane is proposed for the eastbound approach Lancaster Avenue at Ithan Avenue (Synchro Report in TIA, page 296) ; however, the plans indicate a shared right/though lane.

3. As discussed during coordination meetings with Villanova and Township staff, revise the plans to include a dedicated eastbound right turn lane on Lancaster Avenue to provide Radnor Township Police Department the ability to close the travel lane during special events without impeding non-event traffic.

4. Previous coordination meetings included the construction of a pedestrian activated rectangular rapid flashing beacon (RRFB) crosswalk at the unsignalized crossing on Ithan Avenue near South Campus dormitories and Aldwyn Park

5. The unsignalized access to Lancaster Avenue, east of Ithan Avenue, is shown on the conditional use plans as a full access (all turning movements allowed) while the Transportation Impact Assessment (TIA) describes this access as a right-in, right-out with a westbound left-in from Lancaster Avenue. The access should prohibit left turns out of the Pike Garage with channelization to restrict the left movement out of the access as indicated in the TIA.

6. The pedestrian bridge indicates that pedestrians will access the street level on the south side of Lancaster Avenue (adjacent to the proposed dormitories within the driveway median. This is not acceptable and the design should be revised as follows:

    a. The steps should place Villanova foot traffic outside the driveway limits to discourage pedestrians from crossing the Church Walk driveway.

    b. Dormitory students should have direct access from the dormitories to the Pedestrian Bridge without the need to move to the street level. We recommend constructing a raised direct access between the dormitories

and the pedestrian bridge with a possible key card entry for dormitory students to encourage the use of the Pedestrian Bridge over the at-grade pedestrian crossing. Students at street level are less inclined to walk up the steps to gain access to the Pedestrian Bridge if a street level crossing is readily available.

c. Construct a fence along the north side of Lancaster Avenue to prohibit Villanova foot traffic from utilizing the traffic signal at street level to gain access to the parking lot or campus. The fence should be installed along the north site frontage the fullest extent possible to deter Villanova pedestrian traffic from utilizing the traffic signal at Church Walk to cross Lancaster Avenue.

d. Provide an elevator, ramp or other acceptable method to allow handicap users access to the pedestrian bridge where direct access to the pedestrian bridge is not provided.

7. Traffic Calming: The strategy discussed in the Development Impact Study (DIS) includes moving traffic along Lancaster Avenue in an effort to reduce the cut-through traffic experienced in neighborhoods; however, the improvements along Lancaster Avenue are not likely to move traffic along any more quickly than is currently experienced. We recommend discussing traffic calming with nearby affected neighborhoods, particularly Aldwyn Lane residents and considering installing a traffic adaptive system beginning at Lancaster Avenue and Sproul Road/Spring Mill Road & Aldwyn Lane & Kenilworth Road and continuing to County Line Road for a total of six (6) intersections. Furthermore, the traffic calming and traffic adaptive system should be constructed during phase 1.

8. Provide a special event plan with permanent dynamic message signage prior to conditional use approval.

9. Provide a mechanical gate for the Ithan Avenue accesses to both the surface lot and the Pike Garage; the gates will offer Radnor Township Police Department the ability to close or open the accesses during special events.

10. Develop permanent reverse signage and internal vehicular flow for the Pike Garage to allow reverse flow for all accesses during special events.

11. Develop a parking lot identification system with signage and assigned parking for campus users.

B. Development Impact Statement/Transportation Impact Assessment

1. §280-135G(1)(c) indicates the Transportation Impact Assessment (TIA) must follow PennDOT SOL 470-09-4 Transportation Impact Study Guidelines, dated February 12, 2009, as amended, regarding *Policies and Procedures For Transportation Impact Studies*, the TIS should be revised to include the following:

a. Executive Summary
b. List of intersections for study area.
c. Provides dates for when counts were conducted.
d. Intersection Level of Service (LOS) Table with LOS and delay for each approach and critical movement.
e. Provide a description of the existing roadways and intersections within the study area.

2. As required in PennDOT Publication 46 *Traffic Engineering Handbook*

a. Provide a turn-lane length analysis.
b. Provide a table indicating the 95th percentile queues for all intersections.
c. Provide the available and proposed storage length for all movements. The applicant should design the proposed turn-lanes lengths to be the greater of the storage length based on the turn lane analysis and the 95% queue analysis.
d. The capacity analysis should use PennDOT defaults as required in Exhibits 10-9 through 10-11.

2. Revise the TIS to follow HCM2010 methodology in Synchro. We note other approved methodologies may be used at intersections where HCM 2010 methodology cannot be applied; however, most studied intersections can and should follow HCM2010 methodology in Synchro.

3. All signal timings should be optimized for No-Build conditions in accordance with PennDOT SOL 470-09-4.

4. Traffic volumes and Level of Service analysis should be provided for the figures for the proposed right-in/right-out driveway.

5. The actual AM and PM peak hour period may vary from intersection to intersection; however, the analysis should provide the traffic volumes for the peak hour of each individual intersection despite different peak hours in the study area. It appears a consistent uniform peak hour was selected for all studied intersections and the provided analysis does not adequately analyze the worst case scenario.

6. As discussed at previous coordination meetings, the applicant must include a discussion regarding Special Event Transportation Plan. This plan should consider signal timing revisions (including a possible split phase at Ithan and Lancaster), alternative vehicular lane use strategies, social media alerts, and the use of changeable electronic message boards. The strategies should also consider the post event release of vehicles from the Pike Garage and Church Walk surface lot.

7. In general, when a new development is proposed, the vehicular trips associated with the new land development are calculated based on the type of land use and the size of the proposed land use. The applicant indicates there will be no net increase in traffic for the proposed University Student Bookstore, Bistro and the

small convenience store. While we agree that it is very likely the University Student Bookstore will generate fewer trips than predicted by the industry standard, *ITE Trip Generation*, it is unclear how many new trips will be generated. As a comparison and for information purposes, the analysis should include a discussion regarding the total potential trip generation based on the square footage of the proposed Bookstore, Bistro, and convenience store in an effort to determine what the maximum number of vehicle trips generated for the development would be if the development if all trips associated with the improvements were considered "new" trips.

Please let me know if you require additional information or further clarification related to this subject.

Sincerely,

Amy B. Kaminski

RE: Villanova CICD Conditional Use Development Impact Statement
Review No. 1
RETTEW Project No. 101442003

Dear Bill:

At your request, we have completed our review of the above referenced document as prepared by Voith & Mactavish Architects LLP. Our review was of the following information received on July 15, 2014:

1. Thirteen (13) plan sheets dated May 2, 2014;
2. Development Impact Statement dated May 2, 2014;
3. Traffic Impact Statement dated May 2, 2014; and,
4. Miscellaneous Township ordinances and related documents.

Project Overview:

Applicant:	Villanova University
Requested Action/Use:	CICD Conditional Use – Development Impact Statement Review
Zoning District:	PI – Planned Institutional; CO – Commercial Office
Location and Size:	CICD Conditional Use Property is located between Lancaster Avenue and the SEPTA R-100 tracks, and between Pike Field and Moriarty Hall on the Villanova campus, a gross site area of approximately 13.81 acres.
Existing Use:	Surface parking lots
Proposed Use:	Student dormitories, Performing Arts Center, Parking Structure, and student-centered retail.

We have performed a general review of the Development Impact Statement supported by conditional use plans and related documents, and have included comments on the Impact Statement at this point. We may have additional comments as the Conditional Use application moves through the review process and will when more detailed land development plans are submitted.

Our comments below are in the same order as the contents for a Development Impact Statement are listed in the CICD Use in the Planned Institutional zoning district.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – ENVIRONMENTAL & NATURAL RESOURCES

1. Objectives 1 – 3: No comments.

2. Objective 4: In addition to the University's response, the proposed 13-acre development provides for 2 acres of preserved land in the Aldwyn Triangle, which has been designated, at least partially, as a "core reserve wooded area." The Comprehensive Plan strongly recommends that the Township protects and preserves these existing natural areas to the maximum extent *(2-40)*. Preservation by the University of the remainder of the Aldwyn Triangle would help to protect the environmental integrity of the sensitive natural features in the dedicated 2-acre portion and be an indication of the University's intent for the Triangle property to remain a quiet part of the neighborhood.

3. Objectives 5 – 7: No comments.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – HOUSING, DEMOGRAPHICS, AND SOCIOECONOMICS

4. Objectives 1 – 4: No comments.

5. Objective 5: In addition to the University's response, the new on-campus housing provided for over 1,100 off-campus resident students may consequently increase the availability of housing in Radnor Township, especially of rental units. Current demand for housing in Radnor is high, and the Township Comprehensive Plan indicates that another downside of this "more demand than supply" market condition above and beyond rapid increases in price is that households wanting to move into Radnor in the future… will not be able to move in and will be forced to seek alternative locations. This factor may be more significant for certain types of households, certain age groups, or ethnic and racial groups which are more income-constrained, all of which can have implications for future Radnor community building *(3-14)*.

6. Objectives 6 – 10: No comments.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – BUSINESS AND ECONOMIC DEVELOPMENT

7. Objectives 1 – 6: No comments.

8. Objective 7: The University indicates that it pays applicable taxes on unrelated business generating activities. It does not, however, pay business privilege taxes on those business activities it conducts which it considers part of its core mission. The University also does not pay property taxes.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – TRANSPORTATION AND CIRCULATION PLAN

9. One of the goals of Section 5 – Transportation and Circulation Plan of the Comprehensive Plan is to develop traffic calming strategies for implementation, as appropriate, to help preserve neighborhoods. The Development Impact Statement on page 11, however, indicates that no traffic calming is proposed as a method to "reduce the likelihood of cut-through traffic." Instead, proposed traffic improvements to Lancaster Avenue are cited as improving the performance of that key arterial roadway and in doing so will reduce cut-through traffic. Until the University submits its Special Events Management Plan for the post-development condition, and it reworks its Traffic Impact Study to comply with all PennDOT requirements for such studies (see comment under Transportation Impact below), the ability of Lancaster Avenue improvements to reduce cut-through traffic cannot be confirmed. The University has indicated a willingness to install a raised crosswalk and Rapid Reaction Flashing Beacon at Aldwyn and at the two-way access/egress to the Parking Garage on Ithan for pedestrian safety, both of which will help calm traffic speeds. Similar consideration will be needed for traffic calming on Aldwyn Lane, particularly for special event traffic.

10. Section 5 – Transportation and Circulation Plan of the Comprehensive Plan outlines an Access Management Program that "should apply to all roads in the Township, as practical. Reducing the amount of unnecessary curb cuts and access points can also help to reduce delays in traffic flow, accident levels, and pedestrian conflicts" *(5-29).* The University's plan includes the elimination of eight (8) existing 'unrestricted' driveways along Lancaster Avenue between State Route 320 and Church Walk at the West Lancaster Parking area properties.

11. Section 5 – Transportation and Circulation Plan of the Comprehensive Plan also states that the Township should encourage access management methods along U.S. Route 30 and provide access easements through adjoining parcels *(5-32)*. The proposed development contains offered/suggested traffic improvements that include side accesses, deceleration lanes and a reverse frontage road.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – OPEN SPACE AND RECREATION

12. Objective 1: No comments.

13. Objective 2: The proposed development includes the open space dedication of 87,120 square feet (2 acres) in the Aldwyn Triangle in order to meet the CICD ordinance requirement for exceeding 30% building coverage, consistent with the Comprehensive Plan's strong recommendation that such an existing natural area be preserved to the maximum extent *(2-40)*.Preservation by the University of the remainder of the Aldwyn Triangle would help to protect the environmental integrity of the sensitive natural features in the dedicated 2-acre portion and be an indication of the University's intent for the Triangle property to remain a quiet part of the neighborhood.

14. Objectives 3 – 9: No comments.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – HISTORICAL AND ARCHAEOLOGICAL RESOURCES

15. The goal in this plan is not applicable to this development.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – INSTITUTIONAL USE

(Institutional Use is not explicitly listed in CICD Ordinance as a required subject for review but is certainly applicable and comes under the heading of "including, but not limited to" in the text of the CICD Ordinance Development Impact Statement requirement.)

16. The Development Impact Statement does not include any analysis of consistency with Section 8 – Institutional Use of the Comprehensive Plan. As noted above, the project needs to be consistent with the goals and objectives stated in Section 8. Our comments on Section 8 consistency are provided below.

17. The Comprehensive Plan lays out some general principles to be kept in mind when dealing with Institutional land use. For example, the expansion of institutions is to be limited to the areas within the present boundaries of the campus zoned for Institutional use. The University's CICD plan does not expand the current limits of the campus, although the proposed development activity does extend beyond the PI – Planned Institutional zoning district in the form of the 'West Lancaster Parking' area proposed for University property in the CO – Commercial Office zoning district.

18. Further, the Comprehensive Plan asks that existing institutions be harmonized with adjacent land uses by promoting physical buffering. Villanova's plans include the installation of deciduous trees, evergreens, shrubs, and ground cover along most of the CICD district boundaries. To properly buffer adjoining properties (along both the R-100 line and those on Barley Cone Lane), existing buffer vegetation needs to be retained to the fullest applicable extent along with the addition of new vegetation and landscaping. Strategic placement of berms along University property boundaries are needed to help with visual and noise impacts. Section and elevation views of proposed buffering need to be provided to demonstrate the sufficiency of the proposed buffering plan that the University presently suggests will include safety fence and could include modest, sound-dampening masonry walls as appropriate.

19. Section 8 – Institutional Use of the Comprehensive Plan, which was last updated in 2003, states that Villanova University has prioritized a number of plans and projects moving forward. The Comprehensive Plan acknowledges the University's intention of implementing several major building projects, most of which will be in the form of student housing, while maintaining the status quo enrollment figures. Reducing the need for off-campus housing, improving the quality of student life, and minimizing community issues occurring due to a large number of students living off campus are presented as key reasons for the need to build additional residential facilities.

20. Section 8 – Institutional Use of the Comprehensive Plan specifically recognizes that an important issue to the community relates to Villanova's long range plans for its land holdings south of Lancaster Avenue that contain the Main and Pike surface parking lots. The Plan notes that the University has considered the development of a major convocation center there, including a

bookstore plus structured parking with related facilities, very similar to that proposed under the CICD Conditional Use. Features of such a development were to include possible application of traffic calming, gateway enhancements, and other appearance improvements *(8-6)*.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – COMMUNITY SERVICES AND FACILITIES

21. No comments.

COMPREHENSIVE PLAN CONSISTENCY REVIEW – EXISTING LAND USE & LAND USE PLAN

22. Objectives 1 – 4: No comments.

23. Objective 5: The proposed development includes the open space dedication of 87,120 square feet (2 acres) in the Aldwyn Triangle in order to meet the CICD ordinance requirement for exceeding 30% building coverage. Consistent with the Comprehensive Plan's strong recommendation that such existing natural features be preserved to the maximum extent *(2-40),* preservation by the University of the remainder of the Aldwyn Triangle would help to protect the environmental integrity of the sensitive natural features in the dedicated 2-acre portion and be an indication of the University's intent for the Triangle property to remain a quiet part of the neighborhood.

24. Objective 6: In addition to the University's response, to properly buffer adjoining properties (along both the R-100 line and those on Barley Cone Lane), existing buffer vegetation needs to be retained to the fullest applicable extent along with the addition of new vegetation and landscaping. Strategic placement of berms along University property boundaries are needed to help with visual and noise impacts. Section and elevation views of proposed buffering need to be provided to demonstrate the sufficiency of the proposed buffering plan that the University presently suggests will include safety fence and could include modest, sound-dampening masonry walls as appropriate.

REVIEW OF IMPACT ON SENSITIVE NATURAL FEATURES

25. In addition to the University's response, the proposed 13-acre development provides for 2 acres of preserved land in the adjacent Aldwyn Triangle, which has been designated, at least partially, as a "core reserve wooded area" *(2-41)*. Preservation by the University of the remainder of the Aldwyn Triangle would help to protect the environmental integrity of the sensitive natural features in the dedicated 2-acre portion and be an indication of the University's intent for the Triangle property to remain a quiet part of the neighborhood.

26. On page 2, the Development Impact Statement states it is anticipated that redevelopment of the parking lots will increase potential habitat for local wildlife. However, the statement fails to describe the ramifications of increasing wildlife habitat, such as wildlife interactions with humans, motorized vehicles, etc.

27. Page 4 of the report states the proposed development will locate more students within easy walking distance of university related activities, thereby reducing the need to drive to campus and improve air quality in the area. The report further addresses the carbon footprint of moving 1,160

students from off-campus housing to new LEED certified residence halls on campus. This would equate to a reduction of 2,100 car trips per day and would equate to a reduction of 1,162,000 pounds of CO-2 emission every year; however, the reports further states the vacated rental units would be filled with commuter students thereby eliminating all the indicated carbon footprint gains.

REVIEW OF IMPACT ON THE TOWNSHIP AND REGIONAL TRANSPORTATION SYSTEM AND THE ABILITY OF ADJACENT STREETS AND INTERSECTIONS TO EFFICIENTLY AND SAFELY HANDLE THE TRAFFIC GENERATED BY THE PROPOSED DEVELOPMENT

The University's Development Impact Statement indicates that compliance with this section is by virtue of the Traffic Impact Study (TIS) submitted for the development proposal. Therefore, our review of transportation impact focuses on a review of the TIS.

28. As indicated in the Gilmore Review as well as the recent PennDOT review, the TIS must be prepared in accordance with Section 280-135G(1)(c) which indicates it must follow PennDOT's guidelines as contained in PennDOT SOL 470-09-4. Therefore the TIS should be revised to include queue analyses, turn lane needs analyses, and the HCM 2010 methodology. In addition, all SYNCHRO analyses should be revised to incorporate the PennDOT approved default factors and to also include the actual pedestrian calls per hour at the signalized intersections. The level of service tables should be expanded to include the seconds of delay for any unsatisfactory levels of service. A 95th percentile queue table should also be provided. Any recommended turn lane length should be the maximum length as determined from the turn lane needs analysis and/or the queue analysis. These significant revisions to the TIS need to be prepared and reviewed by the Township before any conditional use decision-making occurs in order that the Township can know that the general set of transportation improvements laid out in the plan will efficiently and safely handle the traffic generated by the proposed development.

29. Trip generation for the commercial uses fronting on Lancaster Avenue should be developed from the ITE Trip Generation manual unless specific justification can be provided that would indicate no new trips would be generated from these uses.

30. The analysis in the TIS assumes 4-way STOP control at the intersection of the garage and parking lot along Ithan Avenue. Always stopping traffic flow on South Ithan is not desirable. The analysis of this intersection should assume two-way STOP control of the side streets approaches only. Consideration by the University of a raised crosswalk and Rapid Reaction Flashing Beacon (RRFB) with the 'intersection' designed to accommodate a 4-way stop if determined appropriate in the future is a welcome approach.

31. There is discussion in the TIS that a detailed Special Events Plan for the future development condition is to be prepared by a different consultant. A copy of this plan should be provided for review and comment prior to any decision-making on the conditional use.

32. Capacity and Queue analyses should be provided for the "special event" conditions, particularly along Ithan Avenue and at its intersection with Lancaster Avenue. The TIS 'projects' 176

Eastbound right turns and 220 Westbound left turns onto Ithan Avenue for the peak hour of a special event.

33. The addition of a dedicated Eastbound Lancaster Avenue right-turn lane at Ithan Avenue needs to be investigated for both day-to-day operation as well as special events. Trying to send event traffic further to the east past Ithan to the proposed Lancaster Avenue entrance to the parking garage will still have event traffic out on the mainline of Lancaster Avenue, waiting to make entrance into the garage through a narrow, single lane driveway, while blocking through traffic.

34. There has been discussion by the University of sending special event visitors to the new parking garage via a new entrance into the West Lancaster Parking area, through the West Lancaster Parking area, across Church Walk, and through the parking lot behind the new dorms to Ithan Avenue. No analysis or plan has been submitted to illustrate how this would function.

35. Pedestrian crossings at the intersection of Lancaster Avenue and Ithan Avenue should be reviewed and revised such that they are more perpendicular to the sidewalks. This will provide a shorter distance and less WALK time at the intersection.

36. The TIS indicates the driveway to the east of the Performing Arts Center (PAC) would prohibit left turns out of the driveway, however the submitted plans indicate full egress movement. The plans should be revised to indicate a left turn-out restriction. In addition, information should be provided relating to truck access in and around the PAC.

37. Aldwyn Lane Access: Restricting the traffic flow to a permanent one-way flow would alleviate “cut-through” traffic. This or some other traffic management approach on Aldwyn would require agreement from the residents along this street.

REVIEW OF IMPACT ON RADNOR SCHOOL DISTRICT

38. On Page 20, the report states the addition of student housing will not materially affect the rental housing market in the Township because vacated off-campus student rental housing will be filled by another student living farther away. This statement is contrary to how the report addresses Housing Objectives on Page 5, which states many houses previously rented to Villanova students could be brought back onto the open rental market or potentially sold for re-conversion back to single family residences.

39. There are 125 licensed off-campus student rental units in Radnor Township all within several miles of three colleges and two universities. The report concludes that the quality of these dwelling units is such that they are unlikely to appeal to families, especially families with school age children, and that should any of these units become available they will likely be occupied by another student and not by a family with children. Based on this conclusion, it is estimated that only three new school age students will be generated as a result of this development.

    There is a trend in the housing market away from home ownership. The report should explore this trend and the impact of these rental units not being filled by other students. The age and quality of these units may generate rental prices on the open market that make them affordable

for young families and single-parent households, which will impact student enrollment in the school district.

REVIEW OF IMPACT ON COMMERCIAL FACILITIES WITHIN THE TOWNSHIP AND OTHER MUNICIPALITIES

40. The Development Impact Statement indicates on page 26 that the project includes between 20,000 and 25,000 square feet of retail and restaurant space. However, the development plans submitted with the Impact Statement show a total of 17,000 square feet of bookstore, bistro, and convenience store space. The amount of square feet of the retail/personal service spaces needs to be clarified.

41. Overall, it appears that the proposed development will have a marginal effect on commercial businesses within the Township and other municipalities. More students on campus might increase patronage for Garrett Hill and Wayne businesses. However, the presence of the bistro and convenience store on campus might make it less likely for students to go off campus for those needs. Students already have favorite retail and restaurant establishments and established patronage patterns as a result. It is not likely that there will be significant changes in those patterns.

REVIEW OF IMPACT ON PUBLIC UTILITIES

42. The University's Conceptual Stormwater Management Narrative highlights the 2-year volume difference in runoff as the key objective for the project. However, the University must provide infiltration for one (1) inch of runoff from all proposed impervious surfaces of the project, regardless of the 2-year volume difference. This is a requirement of the Darby/Cobbs Creeks Act 167 Plan and the Township Stormwater Management Ordinance. The infiltration of one (1) inch of runoff was generated as a standard by PADEP and is also a requirement of the City of Philadelphia. Some jurisdictions in other areas require infiltration of 1.5 inches.

43. Section 245.18.B of the Township Stormwater Management Ordinance states that applicants are required to find practicable alternatives to surface discharge of stormwater runoff. Such alternatives would include reuse, ponds, and underground storage. As a minimum to address downstream residents' identified issues the University needs to provide no surface discharge for up to a 10-year storm, but the most environmentally conscious thing they could do would be providing no surface discharge for up to a 100-year storm. This would assist in offsetting flood-causing runoff from the remainder of the Villanova facilities in the drainage area and would be consistent with Villanova's nationwide reputation for stormwater management research and for having been labeled by the Princeton Review as one of the 322 most environmentally responsible universities in the nation.

44. It does not appear that the infiltration/detention facilities under the western end of the West Lancaster Parking area will be feasible due to the substantial slope of the land and existing trees present. The University has indicated that infiltration/detention facilities are no longer being proposed for the land west of Farrell Hall, the Public Safety Building.

REVIEW OF IMPACT ON POLICE AND FIRE PROTECTION

(Reviewed under Fiscal Impact Analysis Overview)

REVIEW OF IMPACT ON OPEN SPACE AND RECREATION FACILITIES

45. The Development Impact Statement does not provide an analysis of the number of students currently using the Township's recreation facilities, nor what facilities they use, and it concludes that all students will utilize on-campus open space and recreation facilities.

    To accurately determine the impact this project has on the Township's open space and recreation facilities, the Impact Statement needs to identify Township open space and recreation facilities that are reasonably accessible, estimate the number of students currently utilizing the Township's open space and recreation facilities, and determine the impact moving more students on campus will have on student usage of Township open space and recreation facilities.

    In addition, Section 255-43.1.B(2) of the Township Code requires non-residential developments to dedicate open space/recreational lands or pay a fee in lieu of.

REVIEW OF IMPACT ON CHARACTER OF SURROUNDING NEIGHBORHOOD

46. The West Lancaster Avenue Parking area, while located outside of the CICD and the Planning Institutional zoning district, is a key element of the proposed development. It is the first project component to be constructed since replacement parking must be provided before spaces in the Pike Lot are lost during parking garage construction and spaces are lost in the Mail Lot during dormitory construction. The West Lancaster Avenue Parking area is separated from nearby residences only by the R-100 Trolley line. Evidence of sufficient noise and light buffering along the proposed parking area in the form of section and elevation drawings need to be provided showing the anticipated results of buffer plantings, gap filling, and retention of existing trees and shrubs. Similarly, buffering elevations for the property behind the parking garage and Performing Arts Center need to be provided.

47. The Development Impact Statement states on page 28 that "the new buildings will create a new audio and visual buffer between Lancaster Avenue and the residential neighborhoods at the South side of the development." However, the presence of approximately 1160 students in the new dorms, plus other proposed traffic generators (parking garage, Performing Arts Center, retail businesses, surface parking), will create new audio and light sources for the neighborhood. In addition, the construction of the new buildings will close off the view of the Chapel and fronting lawn and introduce a new visual – the parking garage and dorms. Thus, buffering section and elevations drawings including combinations of new trees and shrubs, berming, safety fence, modest masonry walls as appropriate to different locations need to be provided.

FISCAL IMPACT ANALYSIS OVERVIEW

48. On page 29, the report indicates that "many of the students who will be living in the proposed development will be moving in from outside of the Township" and "these new residents will now

be more likely to patronize Township establishments more often," leading to more sales and increased gross receipts tax revenues (Business Privilege Tax) for the Township. However, in item #6 on page 6, the report states that "the retail incorporated into the development will also provide ready access to many of the needs of daily student life," suggesting that students will have less need to go off campus as a result of the development. Further, some of the students moving into the new dorms will be those currently occupying West Campus dorms and are already on campus. Students, whether currently living on or off campus have favorite places inside and outside of the Township and their patronage patterns are not likely to change much. It is unclear which direction gross receipts tax revenues (Business Privilege Tax) will head.

49. The report notes that the University is not subject to property taxes nor is it expected that the retail uses that are part of the project and the University's core mission will pay any business taxes. The report goes on to say that roughly $5.6 million dollars in one-time permit fees and gross receipts taxes will be paid by the University and its contractors as a result of the construction of the proposed development. These one-time fees are not a windfall for the Township. They are fees to cover the costs of Township services provided during the development process including construction code plans review and inspections. Further, most all development in the Township must pay building permit fees and their contractors pay gross receipts taxes. The key distinction is that the University pays no property taxes. Private sector development at a value similar to the $269 million cited for the proposed development would generate approximately $1,009,000 annually in property taxes to the Township (at the 2014 property tax rate), plus roughly $750,000 in Business Privilege taxes could be generated on gross receipts each year.

50. On page 30, the report indicates that "the project will not cause any additional burden on Township administration" or the Community Development budget. The administration, coordination, and execution of review of the project and enabling zoning ordinance amendment has actually caused quite a burden on Township administration and Community Development.

51. The report on page 32 states that the potential increase in police calls (estimated to be 55) attributable to the project is small compared to the total number of calls handled by the Police Department. The report needs to state the total number of calls, calculate what percent of total calls is represented by the 55 additional calls, and apply that percentage to the Police Department's budget of roughly $8 million to calculate the approximate cost of those 55 additional calls and to determine the need for additional resources by the Police.

52. On Page 33 under Public Works, the report states that it is possible that the Township will see a decline in roadway maintenance expenditures due to fewer students driving. This contradicts the statement earlier in the Development Impact Statement that it is anticipated that the vacated off-campus student housing is expected to be filled with students, requiring them to drive, or rented on the open market. Those occupants will have similar driving patterns as those who currently live in those units such that there would be an overall increase in driving activity and wear and tear on area streets.

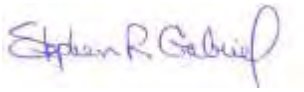
53. The report also notes on page 33 that "the University will maintain the sidewalks along Lancaster Avenue, further decreasing possible Township expenses." Section 250-9 of the Township Code requires property owners to maintain the sidewalk along their property such that this

maintenance of the sidewalks by the University is a current duty and does not represent a shift in responsibility and a decrease in possible Township expenses.

54. On page 34, the report notes that the proposed development's township-compliant stormwater management system will help reduce stormwater runoff from the site, potentially lowering costs borne by Township Public Works. It should also be noted that there has been a burden on the Township for many years of stormwater runoff discharge from the surface parking lots where there has been little or no stormwater management in place.

Should you have any questions or require any additional information, please do not hesitate to contact us at any time.

Sincerely,



Stephen R. Gabriel, PP

August 1, 2014

DELAWARE COUNTY, RADNOR TOWNSHIP
S.R. 0030 (LANCASTER AVENUE)
HIGHWAY OCCUPANCY PERMIT APPLICATION NO. pre913
VILLANOVA UNIVERSITY
TRAFFIC LOG NO.: D13-008XR
PRELIMINARY REVIEW

Frank Tavani, P.E., PTOE
F. Tavani and Associates, Inc.
105 Kenilworth Street
Philadelphia, PA 19147

Dear Mr. Tavani:

The Department has reviewed the preliminary submission of the Traffic Impact Assessment dated August 27, 2013 for compliance with applicable Department Regulations. This review has identified deficiencies that must be addressed in order for your application submission to be processed as efficiently as possible.

The Department understands that the provided analysis is preliminary in nature. As such, the Department reserves the right to make future additional comments based on the formal submission of a complete Transportation Impact Study.

Our comments on your preliminary submission are as follows:

PRELIMINARY COMMENTS

1. Future submissions should include a letter that describes how each comment, from this or previous reviews, has been addressed and where each can be found in the associated studies or plans. Based on the manner in which this project has taken place the inclusion of formal review letters and/or comments provided via email may be appropriate.
2. Transportation Impact Study
   a. The PennDOT project number, D13-008XR, for this preliminary review must be referenced when the formal HOP application is submitted.
   b. In consideration of the previously submitted information and coordination to date, future submissions to the Department may be limited to:
      i) Site accesses to State Routes

ii) S.R. 0030, from S.R. 0320 to Garrett Avenue

iii) S.R. 0320 and County Line Road

c. Based on the magnitude of the anticipated modifications associated with the proposed development, including roadway modifications and traffic re-distribution, the submitted document is considered a Transportation Impact **Study** and should conform to the Department guidelines as such. As previously noted, this includes:

i) Land Use Context

ii) Roadway Classification (reference the Smart Transportation Guidelines)

iii) Pedestrian and Bicycle Facilities

iv) Photographs of study intersections and accesses

v) Sight distances at access

vi) Turn lane warrant analysis for site accesses and intersections serving the site (e.g. Ithan Avenue)

d. The study should consider an alternative that includes providing an eastbound right turn lane on S.R. 0030 approaching Ithan Avenue. The right turn lane is a recommended improvement and not a requirement from the Department.

e. As previously noted, tables and figures should be organized so that there is a clear flow from trip generation to trip distribution and the resulting Levels-of-Service.

f. The crash history noted six accidents involving pedestrians. Additional information should be provided to determine if there is a correctable pattern or other elements that should be considered as part of this project.

g. As previously noted, additional information is also needed for the Performing Arts Center accesses, addressing proximity to the signal, flow and restrictions, etc. Specific issues include the manner in which previous submissions appeared to direct traffic away from Ithan Avenue and the operation of the full-movement access to S.R. 0030, including evaluation of the access pre and post event.

h. Please note that the various materials submitted in relation to this project include minor discrepancies in the campus-wide parking supply figures. These are generally minimal and are not expected to change the results of the analyses; however they should be addressed as part of future submissions.

i. As previously noted, Level-of-Service data tables should include the delay in seconds for each lane group operating at LOS F.

j. Verify that the figures clearly illustrate proposed volumes at all accesses to state roads, including but not limited to the proposed right in and right out access to the modified commuter lot along S.R. 0030.

k. The Synchro analyses should address the following:

   i) Ensure that Future Build volumes are consistent with the submitted figures.

   ii) Per the current Highway Capacity Manual the overall intersection peak hour factor should be used.

   iii) Ensure that all turn lanes are coded appropriately.

   iv) As previously noted, ensure that the pedestrian phase clearance intervals are coded appropriately. In particular, for S.R. 0030 and Ithan Avenue:

      (1) Ensure that pedestrian times meet or exceed the minimums for existing (26 seconds per the current Traffic Signal Permit) and future conditions.

      (2) Enter an appropriate number of pedestrian calls. If the number of calls is assumed to be reduced under future conditions due to proposed improvements, include documentation of the methodology used to develop the assumed number of calls.

   v) Ensure the appropriate coordination and recall settings are utilized.

l. The submitted Conditional Use Plan shows two lanes exiting Chapel Drive to S.R. 0030; verify that this is addressed in the analyses.

3. Conditional Use Plans

   a. Note that all improvements will be required to comply with current ADA standards.

   b. To the maximum extent feasible existing accesses to S.R. 0030 within the project limits should be removed where new access is provided as part of the proposed development (e.g. the two story buildings adjacent to the West Lancaster Parking).

   c. Future submissions should include calculations supporting the proposed transition taper lengths.

   d. The westbound stop bar for S.R. 0030 approaching Church Walk appears too far west; adjusting this will impact the proposed eastbound transition taper.

   e. The eastbound stop bar for the S.R. 0030 left turn lane approaching Ithan Avenue may need to be adjusted to account for the shifting of the northbound left turn lane.

   f. Consideration of re-aligning the crosswalks at S.R. 0030 and Ithan Avenue may be warranted as a means to reduce pedestrian crossing distances.

   g. Ensure that appropriate visibility is maintained for the pedestrian crossing of the Performance Arts Center access; the magnitude of the setback may warrant reconsideration.

The Department has performed this preliminary review based only on the limited information provided. We reserve the right to make future, additional, detailed comments based on the formal submission and application for a Highway Occupancy Permit. If you have any questions pertaining to the technical aspects of this review, please contact Albert Federico, P.E., PTOE of McCormick Taylor, Inc. at 215.592.4200 or apfederico@mtmail.biz.

Respectfully,

Francis J. Hanney

APPENDIX C

Smart Transportation Guidelines

SMART TRANSPORTATION GUIDEBOOK

Planning and Designing Highways and Streets that Support Sustainable and Livable Communities

New Jersey Department of Transportation

Pennsylvania Department of Transportation

MARCH 2008

4.0 Land Use Context

Land use context and roadway type comprise the organizing framework for the selection of appropriate roadway design values. A context area is a land area comprising a unique combination of different land uses, architectural types, urban form, building density, roadways, and topography and other natural features. The existing and planned land use context should be defined on every project. The roadway design should be compatible with the existing land use context, or a planned land use context that reflects the community vision.

4.1 WHY CONTEXT MATTERS

Understanding the land use context provides guidance on who will need to use the road and how. This understanding influences the geometric design of the roadway and the types of amenities required in the right-of-way.

For this document, the design elements are organized into three general categories:

Desired Operating Speed: This is the speed at which it is intended that vehicles travel. The roadway context should play a large role in determining the desired operating speed. For example, pedestrian travel and the presence of civic uses and retail close to the street all suggest the need to use the lower range of the desired operating speed.

Roadway: The design team should select roadway elements and geometry with a clear understanding of surrounding land uses. For example, in urban areas the design team should always seek to provide parking lanes. Travel lanes are often narrower than in suburban areas, particularly if this enables the installation of bike lanes.

Roadside: The roadside primarily serves the pedestrian and the transit rider and provides a transition between public and private space. The design of the roadside elements should support the land use context. Civic uses such as schools and parks, and high density neighborhoods which generate higher pedestrian activity may require wider sidewalks.

A Tale of Two Contexts

Route 30, classified as a principal arterial, has a cross-section of four 10 ft. travel lanes in both Ardmore, PA, and Wayne, PA, as shown below. The speed limit on both roads is 25 mph. In a workshop for this guidebook, DVRPC stakeholders agreed that the Wayne town center is friendlier for pedestrians, identifying Route 30 in Wayne as "an example of an arterial roadway that has evolved to a village feeling." The difference? In Wayne, the presence of on-street parking and the traditional town center context (with zero building setbacks) results in more watchful motorists and creates a defined space for pedestrians. With sporadic on-street parking and with the greater prominence of parking lots, Ardmore is an example of a suburban center.

4.2 DEFINING LAND USE CONTEXT

Seven context areas are described in the following section, from the least to the most developed: Rural, Suburban Neighborhood, Suburban Corridor, Suburban Center, Town/Village Neighborhood, Town Center, and Urban Core.

The context areas are illustrated in Figure 4.2. This drawing does not arrange the areas in order of intensity, but is an illustrative example of how these areas might fall across the land.

"Quantifiable characteristics," summarized in figure 4.3, are provided for each context. They are similar to what community planners refer to as "bulk standards," normally used to prescribe the desired appearance of land uses within a zoning district. Each land use context should be identified based upon this information.

In practice, land uses do not always fit neatly into the defined context areas, or the boundaries between context areas may be fluid. The planner or designer should use their best judgment in selecting the context that most closely matches the existing and proposed land uses.

It is recommended that contexts be broadly defined, avoiding segments less than 600 ft. in length. This is largely an issue of practicality. There is a limit on the number of different roadway cross-sections that can be implemented to respond to land use context within a small area.

1. Rural

This context area consists of a few houses and structures dotting a farm or forest landscape. The areas are predominantly natural wetlands, woodlands, meadow or cultivated land. Small markets, gas stations, diners, farm supplies, convenience grocers, etc. are often seen at the intersections of arterial or collector roads. Areas with a few commercial or civic uses and a number of homes close to the roadway can be placed into the sub-context type of "rural hamlet." Once the population of the settled area exceeds 250, it should be classified into the town/village context.

Examples include areas of Burlington and Gloucester Counties to the east, and Tioga and Jefferson Counties to the west.

2. Suburban Neighborhood

Predominantly low-density residential communities, many built since WWII. House lots are typically arranged along a curvilinear internal system of streets with limited connections to regional road network or surrounding streets. Lot sizes are usually two acres to one-quarter acre, but in older suburbs, it is common to find one-eighth acre lots. Garden apartments are also included in this type. Neighborhoods can include community facilities such as schools, churches, recreational facilities, and some stores and offices. When suburban houses line an arterial roadway but have their primary access to frontage roads or rear access roads, it is possible to classify this area as a "suburban corridor."

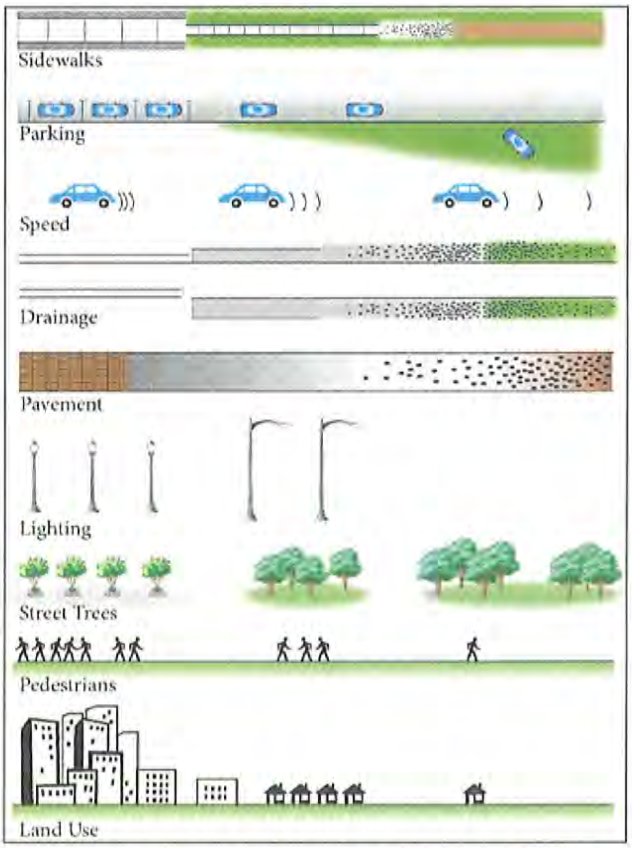

Figure 4.1 From Urban to Rural. As intensity and mix of uses along a roadway increase, there is a greater need to accommodate and prioritize other modes of travel, including bicyclists, pedestrians, and transit riders.

Figure 4.2 The Seven Land Use Contexts

3. Suburban Corridor

This area is characterized by big box stores, commercial strip centers, restaurants, auto dealerships, office parks, and gas stations. These uses are sometimes interspersed with natural areas and occasional clusters of homes. Buildings are usually set back from the roadway behind surface parking. Office buildings are usually set back a bit more than adjacent retail frontage to establish garden separation from ground windows.

These areas are found along many arterial roadways, such as Route 38 in Cherry Hill and Route 611 north of Philadelphia.

4. Suburban Center

Often a mixed-use, cohesive collection of land uses that may include residential, office, retail, and restaurant uses where commercial uses serve surrounding neighborhoods. These areas are typically designed to be accessible by car, and may include large parking areas and garages.

They are less accommodating to pedestrians than town centers, and opportunities to cross the primary roadway can be limited. On-street parking may or may not be provided.

Examples include Lancaster Avenue in Ardmore, PA, and Montgomery Avenue in Bryn Mawr, PA.

5. Town/Village Neighborhood

Predominantly residential neighborhoods, sometimes mixed with retail, restaurants and offices. In urban places, residential buildings tend to be close to the street. Rowhouses fronting the sidewalk, and houses back 30 feet behind a front lawn are both common types. Small retail establisments sometimes occupy principal corners. Block sizes are regular and often small in comparison to suburban neighborhood blocks. Even where streets are narrow, on-street parking is common and typically well used. The large majority of neighborhoods have sidewalks.

Existing examples include Fairview in Camden and Society Hill in Philadelphia.

Figure 4.3 Defining Contexts

	Rural	Suburban Neighborhood	Suburban Corridor	Suburban Center	Town/Village Neighborhood	Town Center	Urban Core
Density Units	1 DU/20 ac	1 DU/ac - 8DU/ac	2 - 30 DU/ac	3 - 20 DU/ac	4 - 30 DU/ac	8 - 50 DU/ac	16 - 75 DU/ac
Building Coverage	NA	< 20%	20% - 35%	35% - 45%	35% - 50%	50% - 70%	70% - 100%

6. Town/Village Center

A mixed use, high density area with buildings adjacent to the sidewalk, typically two to four stories tall with commercial operations on the ground floor and offices or residences above. Parallel parking usually occupies both sides of the street with parking lots behind the buildings. Important public buildings, such as the town hall or library, are provided special prominence.

Places like Haddon Avenue in Collingswood and State and Main Streets in Doylestown are classic "Main street" town centers.

7. Urban Core

Downtown areas consisting of blocks of higher density, mixed use buildings. Buildings vary in height from 3 to 60+ stories with most buildings dating from an era when elevators were new technology - so five to twelve stories were the standard.

Examples are Trenton's Downtown and Center City Philadelphia.

4.3 PLANNING FUTURE CONTEXT AREAS

The planned land use context along the corridor is assessed by consulting the following plans and documents:

- Municipal comprehensive plan (referred to as master plan in New Jersey)
- Multi-municipal or regional comprehensive plan (applicable in Pennsylvania)
- Zoning ordinance
- Redevelopment plan (if applicable)
- State Plan designation (applicable in New Jersey)

As part of the collaboration between state and community, the study team consults with local stakeholders on the vision for their community. If no vision exists, a workshop or charrette can be held to help crystallize the community vision.

5.0 Transportation Context

Routes 1 and 27 in Central New Jersey (below) are both classified as principal arterials in traditional functional classification, but they have very different roles within the roadway network. This chapter proposes a new roadway typology to better capture the role of roadways in a community.

The transportation context consists of the role that the roadway plays, or is anticipated to play within the local community and the larger region. It also refers to the supporting street network, and the interaction of the roadway with that network.

5.1 ROADWAY TYPE

A new roadway typology is proposed for the Guidebook in order to design roadways that better reflect their role in the community and the larger transportation network.

Currently, every roadway owned by NJDOT or PennDOT, or by county governments in New Jersey, is assigned a functional classification consistent with the AASHTO Green Book:

- Principal Arterial
- Minor Arterial
- Collector (subdivided into major collector and minor collector within rural areas)
- Local

A problem with the existing functional classification system is that an entire highway is sometimes placed into a certain class based on select characteristics – such as the overall highway length, or traffic volumes – although its level of access and mobility are not consistent with other roadways in that class. For example, many state highways are classified as principal arterials even if they are far more vital to community access than to regional mobility. This creates a dilemma for highway designers: the application of design standards for that class may encourage higher operating speeds than are appropriate for segments serving community access.

To address this issue, a roadway typology is proposed which better captures the role of the roadway within the community. It focuses more narrowly on the characteristics of access, mobility and speed. If a segment of an arterial roadway has a relatively low speed, is important to community access, and has a lower average trip length, it should not be designed like a high order arterial. Further, under this approach, roadways

Route 1

Route 27

are segmented to a greater degree than traditional functional classification. If one segment of a roadway has low average trip lengths and has consistently lower speeds, its design should be different than another section which carries long trips.

The roadway typology is presented in Table 5.1 and illustrated in Figure 5.1. It should be emphasized that this should be used only as a planning and design "overlay" for individual projects, and does not replace the traditional functional classification system used in both states. The roadway classes shown in Table 5.1 correspond to the classifications of arterial, collector and local as described in the 2001 AASHTO Green Book. Their design values should likewise correspond to the design guidelines provided in the Green Book.

Different state highways have different community roles, and the Guidebook recommends that this should be reflected in the design. Some state highways, such as NJ Route 1, will be considered as a Regional Arterial because of their importance to regional mobility. On the other hand, Route 27, which is classified as a principal arterial by NJDOT, actually operates more like a community arterial or a community collector. Parallel to Route 1 and the New Jersey Turnpike, this highway has a low average trip length. Maintaining regional mobility becomes a smaller concern on Route 27 and similar state roadways.

Whatever the road classification, traffic mobility and safety are important goals on state highways, and must be considered on all roadway projects. These goals will continue to receive significant attention on roads with acute safety or congestion problems. Mobility and safety goals are balanced with local development goals on projects.

PennDOT owns many roads in Pennsylvania, from arterials down through local roads. NJDOT controls a much smaller share of the road network, and virtually all of its roadways are arterials. Because of the relatively high volumes found on many NJDOT roadways, the maintenance of mobility on regional arterials remains a strong emphasis.

5.1.1 Main Street

Although not one of the Smart Transportation roadway categories, the concept of Main Street has an important place in Smart Transportation. Anchoring the center of a town, village or city, the Main Street is characterized by:

- Wide sidewalks and regular pedestrian activity;
- Mostly commercial and civic uses, with residential uses primarily found on the upper level of buildings;
- High building density;
- Buildings oriented to the street, with little or no building setbacks;
- Street furniture and public art;
- Heavy use of on-street parking;
- Speeds of 30 mph or less;
- Preferably no more than two travel lanes, although three to four lanes are seen on occasion.

Table 5.1 Roadway Categories

Roadway Class	Roadway Type	Desired Operating Speed (mph)	Average Trip Length (mi)	Volume	Intersection Spacing (ft)	Comments
Arterial	Regional	30-55	15-35	10,000-40,000	660-1,320	Roadways in this category would be considered "Principal Arterial" in traditional functional classification.
Arterial	Community	25-55	7-25	5,000-25,000	300-1,320	Often classified as "Minor Arterial" in traditional classification but may include road segments classified as "Principal Arterial."
Collector	Community	25-55	5-10	5,000-15,000	300-660	Often similar in appearance to a community arterial. Typically classified as "Major Collector."
Collector	Neighborhood	25-35	<7	<6,000	300-660	Similar in appearance to local roadways. Typically classified as "Minor Collector."
Local	Local	20-30	<5	<3,000	200-660	

Route 27, Kingston

Route 27, Princeton

The Main Street would typically belong to the Community Arterial road type, or to the Collector road type. This is the case on Route 27 in New Jersey; this roadway hosts two Main Street segments between New Brunswick and Trenton, in the towns of Princeton and Kingston. As defined here, a municipality can have more than one Main Street.

Main Streets are desirable in Smart Transportation because they support more sustainable communities, and because of their potential to increase walking, biking and transit use, as well as vehicular trip chaining.

For information on planning Main Streets, see Section 6.2.1.

5.2 ROADWAY NETWORK

Network design establishes critical parameters for roadway design—type of roadway, its general purpose (i.e., what type of traffic it is to handle) and number of lanes necessary to achieve the purpose. By increasing the options of motorists to travel from one point to another, a well-connected regional network permits greater flexibility in designing individual roadways. Improving roadway connectivity can serve regional mobility equally well as widening major roadways, and a well-connected network always serves the needs of pedestrians and bicyclists better than simply widening arterial roadways.

Because network connectivity is so important in Smart Transportation Solutions, it appears as a recurring theme in this guidebook. Network types, basic principles, and evaluating and creating a network are discussed in this section and in Chapter 3, "A Local Commitment."

5.2.1 Network types

The traditional urban grid has short blocks, straight streets, and a crosshatched pattern (Figure 5.2). The typical contemporary suburban street network has large blocks, curving streets, and a branching pattern (Figure 5.3). The two networks differ in three respects: (1) block size, (2) degree of curvature, and (3) degree of interconnectivity.

Both network designs have advantages and disadvantages. Traditional grids disperse traffic rather than concentrating it at a handful of intersections. They offer more direct routes and hence generate fewer vehicle miles of travel (VMT) than do contemporary networks. By offering many different routes to a destination, they better meet the needs of local motorists. They encourage walking and biking with their direct routing and their options for travel. Grids are also more transit-friendly; transit ridership is greatest between tracts that have relatively direct transit connections.[3]

Contemporary networks do have some advantages, such as the ability to lessen traffic on local residential streets. With their curves and dead ends, contemporary networks can go around or stop short of valuable natural areas.

Traditional grids best fulfill Smart Transportation goals, and are recommended for application in most areas.

5.2.2 Evaluation of the network

All roadway networks should be evaluated using the measures on internal connectivity, external connectivity, and route directness.

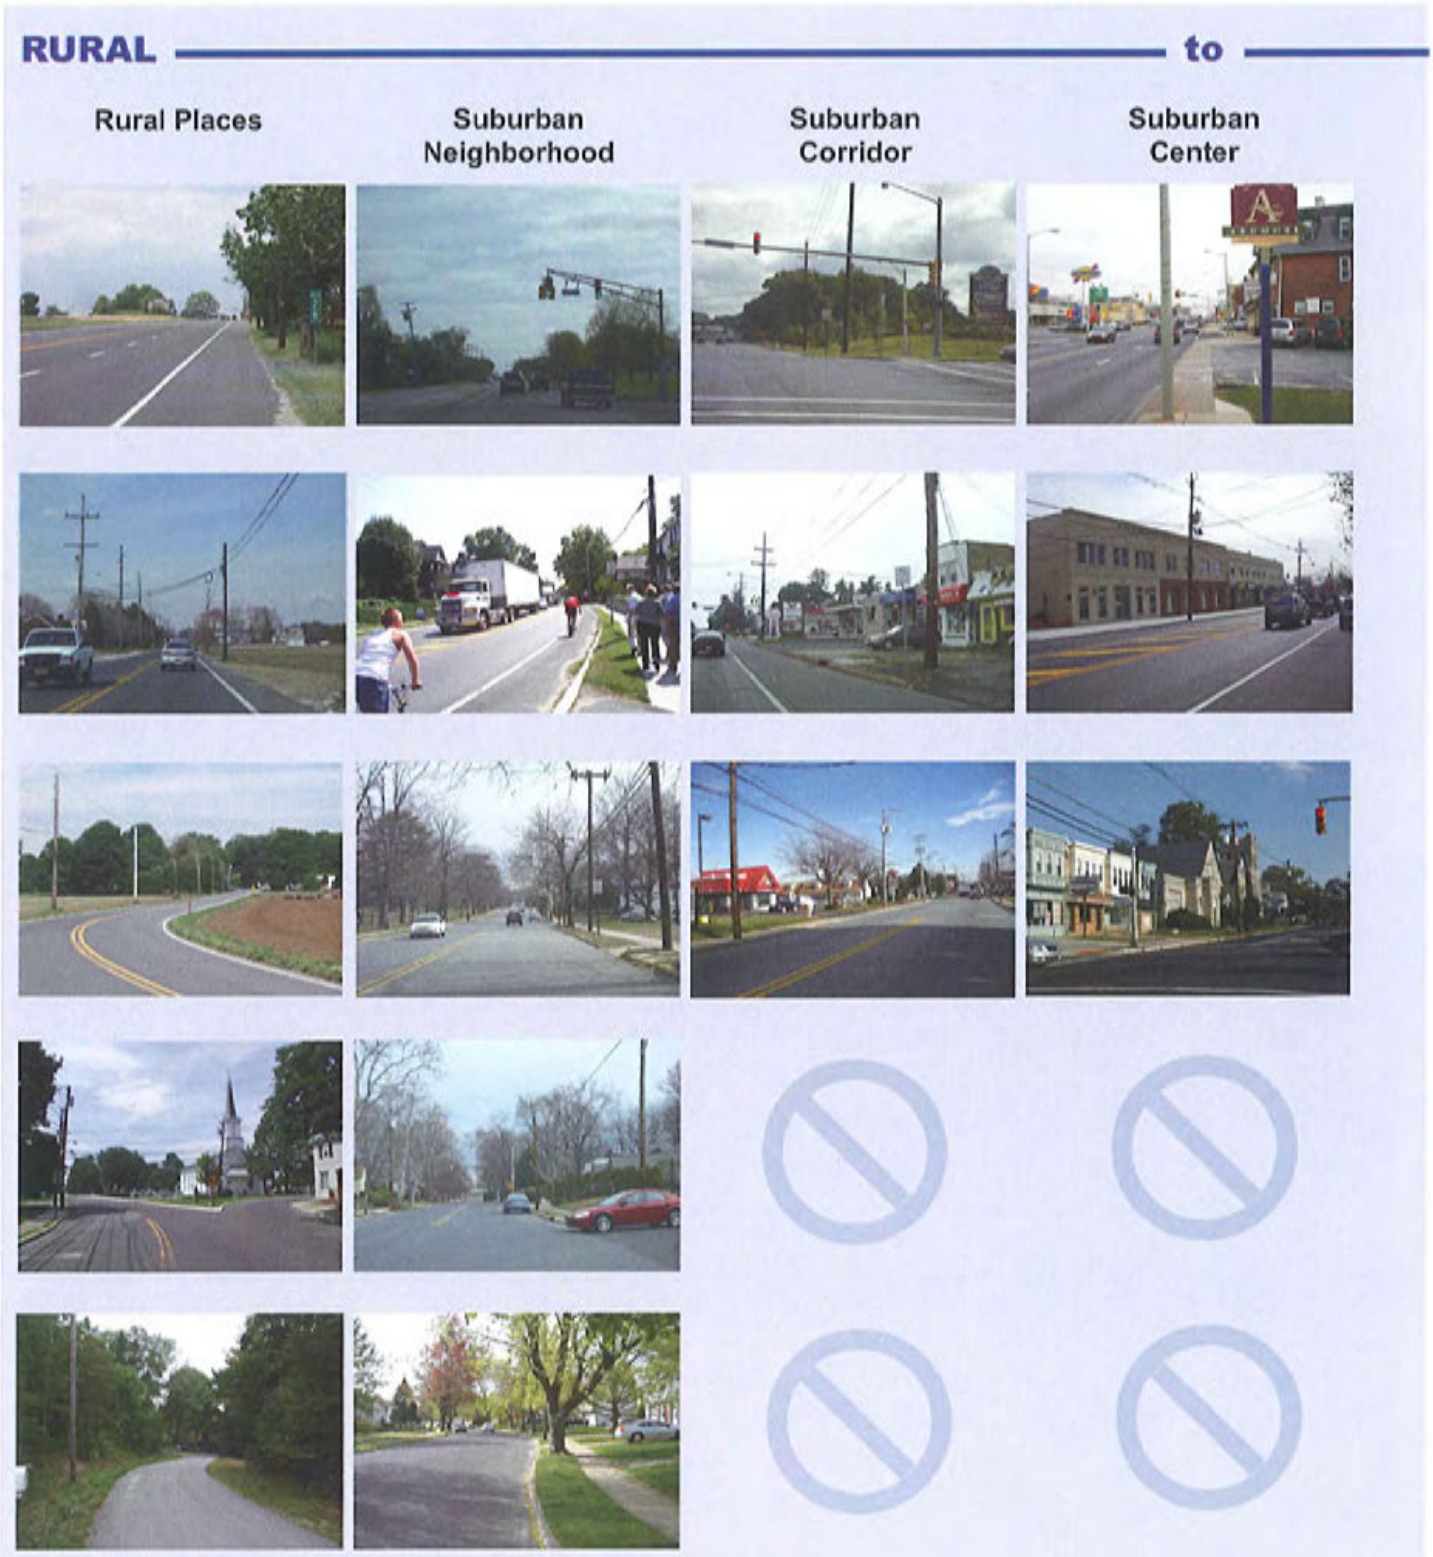

Figure 5.1 Roads in Context

URBAN

Town/Village Neighborhood	Town Center	Urban Core		
			REGIONAL	Regional Arterial
				Community Arterial
			to	Community Collector
				Neighborhood Collector
			LOCAL	Local Road/ Street

The photos enclosed in a yellow box indicate the Town Center and Core City streets that also operate as a local or regional Main Street.

Internal Connectivity. *Use either of the following two measures:*

- **Beta Index** — This is equal to the number of street links divided by the number of nodes or link ends. A higher ratio indicates higher street connectivity. When applied to the developments shown in Figures 5.2 and 5.3, Apalachicola is rated 1.69, and Haile Plantation is rated 1.19. Traditional developments generally rate above 1.4. [4]
- **Intersections per square mile** — Strict grid systems have about 25 intersections per square mile, while conventional branching systems have about one-third to one-half that many. [5]

External Connectivity

- All neighborhoods in the community should be connected to the larger street system at least every ¼ mile.

Route Directness

- This measures the distance a pedestrian would walk between two points compared to the straight line (or radial) distance between the same two points. The closer the ratio is to 1.0, the more direct the route; route directness values of 1.2-1.5 describe reasonably connected walkable networks. [6]

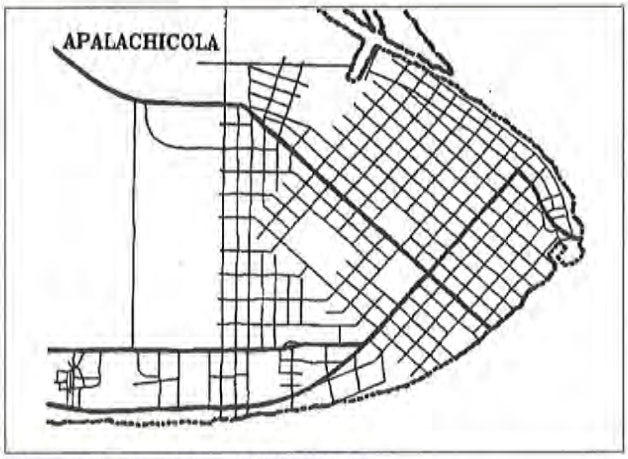

Figure 5.2. Traditional Urban Grid

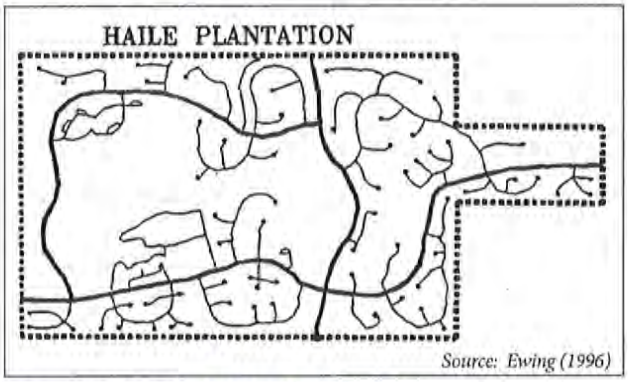

Figure 5.3. Contemporary Branching Network

5.3 CREATING EFFICIENT NETWORKS

In Smart Transportation, network evaluation becomes a critical task anytime existing or projected traffic congestion is identified as a potential issue on projects. The role of the network differs somewhat for projects in built-out areas versus newly developing areas.

5.3.1 Existing and Built-out Areas

In a built-out area, can the network be improved such that local traffic can use local streets to a greater degree? It should be determined how much traffic can be removed from regional roadways if the local and collector system is made to work more effectively. The network should be evaluated using measures of internal connectivity, external connectivity, and pedestrian route directness, described in Section 5.2.2.

If improving the network will not address the problem or is not an option, the two primary choices are to widen the roadway or to build a parallel roadway.

Roadway widening

The planner should first determine if segment improvements, access management, or intersection changes will address the problem, and then consider mainline widening. Widening should be done only if the resulting roadway is compatible with the land use context. Planners should identify the existing roadway role, its consistency with the community vision, and whether an alternative roadway type would better support the community.

Parallel roadway

If a parallel roadway is necessary, the planner should consider development of a regional or community arterial. It should be consistent with an area network plan, and be tied in where possible to the existing road system. This would improve the effectiveness of this road link.

5.3.2 Creating a Road Framework for New Development

A newly developing area offers the opportunity to implement a highly connected street system with less reliance on multi-lane arterials. Following are guidelines to be used in laying out a context sensitive roadway network capable of providing safe, multimodal choices for all trips. Initial planning should identify higher order roads needed for ultimate build-out; local roads and neighborhood collectors should then be included, depending upon specific developments proposed.

Network Configuration – Areawide

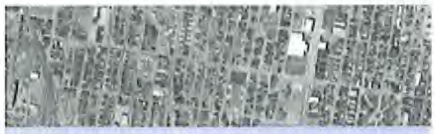
- Arterial roadways should be continuous and networked in generally rectilinear form with spacing of ½ to 1 mile in suburban contexts and ¼ to ½ mile in urban contexts. Closer spacing may be needed depending on activity levels and through movements.
- Collectors may be spaced at 1/8 mile intervals, if needed.
- Urban cores and town centers should be connected by community arterials and community collectors. These roadways should have the area's highest level transit service.
- Collectors should link neighborhood centers with adjacent neighborhood centers and town centers. All such connectors should be able to accommodate transit service.
- Major roadways that are to serve as major truck routes or primary through traffic routes should avoid the centers of urban areas or neighborhoods wherever possible. Community arterials and community collectors may be designated local truck routes to reach clusters of commercial uses in centers or cores.
- Sketch planning demand estimation or travel forecasting models should be used to estimate the density/spacing and capacity needs for major roadways beyond the minimum spacing described above.

Spacing

- Irrespective of thoroughfare spacing, pedestrian facilities should be well networked. In suburban contexts, block sizes of no more than 600 feet on a side with a maximum area of 7 acres will provide a reasonable level of connectivity.[7] In urban contexts, block sizes of 300 to 400 feet with a maximum area of 3-4 acres are ideal.
- Where streets cannot be connected, provide bike and pedestrian connections at cul-de-sac heads or midblock locations as a second-best solution to accessibility needs. Recommended maximum spacing is 330 ft.
- Bicycle-compatible roadways should comprise a bicycle network of parallel routes with effective spacing of ½ mile.

5.3.3 Network principles

All new networks should be evaluated using the measures on connectivity in Section 5.2.



Route 63, a principal arterial highway, runs through Harleysville, PA (top) and Lansdale, PA (bottom). Harleysville lies six miles northwest of Lansdale, with I-476 passing between the two municipalities. Motorists on Route 63 in Harleysville have an average trip length of 30 miles, much longer than the 10 mile average trip length of motorists found on Route 63 in Lansdale. Motorists commuting from the north prefer to take I-476 into Philadelphia, and avoid driving through Lansdale. Further, Route 63 in Lansdale serves as that borough's main street. The highway thus serves a different role in these two municipalities.

5.4 SIGNAL SPACING

Recommended signal spacing corresponds to the optimal spacing of arterial, collector and local streets (Table 5.2), although signals should be installed only where warranted.

Signal spacing of 300 ft. on arterials and collectors can be an important strategy in complementing traditional grid networks where low traffic speeds and high pedestrian activity are desired. On roadways in traditional urban contexts where regular cross traffic flows can be accommodated by stop-controlled intersections, signal spacing of 500 to 660 ft. on arterials and collectors may be sought.

On lower order suburban roadways, spacing of 660 ft. (1/8 mile) permits safe pedestrian crossings at the upper boundary of desirable block lengths. Signal spacing of 1320 ft. (1/4 mile) begins to permit the speed progression sought by NJDOT or PennDOT on those corridors where traffic flow is a priority.

The spacing of traffic signals has a major influence on roadway operating speeds and capacity. Studies have found that a four lane divided arterial roadway with signal spacing of 2640 ft. carries the same amount of traffic as a six lane arterial with signals spaced at 1320 ft.[8] Neither situation is optimal for pedestrians. On the one hand, narrower roadways are more amenable to pedestrian crossings. On the other hand, wider signal spacing reduces the opportunities for pedestrians to cross roadways at controlled locations. Further, motorists who desire to turn left onto an undivided major roadway may be tempted to access it at a Stop-controlled crossing, rather than traveling farther out of their way to access the roadway at a signal. On higher-order roadways where major pedestrian generators straddle the corridor, the best choice is sometimes smaller signal spacing and acceptance of a lower progression speed.

Table 5.2. Recommended Signal Spacing

	Urban Contexts	Suburban Contexts	Rural Contexts
Regional Arterial	660 to 1320 ft.	1320 to 1540 ft.	1980 ft.
Community Arterial	300 ft. to 1100 ft.	1320 ft.	1540 ft.
Community Collector	300 to 660 ft.	660 to 1320 ft.	1540 ft.

APPENDIX E

Data Collection

DATA COLLECTION DETAILS

(This appendix is based on a submittal entitled "Deliverable #1" which was shared with the township and PennDOT on or about 01-15-2013)

FTA conducted turning movement traffic counts at the following 17 intersections in the fall of 2012:

1) Lancaster Avenue and Spring Mill Road / Kenilworth Road / Aldwyn Lane
2) Lancaster Avenue and Church Walk
3) Lancaster Avenue and Ithan Avenue
4) Lancaster Avenue and Lowrys Lane
5) Lancaster Avenue and Garrett Avenue
6) Conestoga Road and Sproul Road
7) Conestoga Road and Spring Mill Road
8) Conestoga Road and Ithan Avenue
9) Conestoga Road and Lowrys Lane
10) Conestoga Road and Garrett Avenue
11) County Line Road and Spring Mill Road
12) County Line Road and Ithan Avenue North
13) County Line Road and Ithan Avenue South
14) County Line Road and Lowrys Lane
15) County Line Road and Airedale Road
16) County Line Road and Roberts Road
17) Ithan Avenue and Aldwyn Lane

COUNT PERIODS

The count periods selected for analysis were weekday commuter AM and PM peak periods. These count periods were chosen for multiple reasons. First, Automatic Traffic Recorder (ATR) or 'tube' counts were available and recently conducted along Route 30 by the Delaware Valley Regional Planning Commission (DVRPC). The results of these counts identify that the sum of all traffic volumes in the study area -- which includes both Villanova traffic and non-Villanova traffic (commuter traffic, regional through traffic, other institutional traffic, etc.) -- combine to reach a peak typically between 7 and 9 AM in the morning and 4 and 6 PM in the afternoon. Discussions with Villanova staff also support these hours as featuring peak activity levels on campus. FTA's experience with the campus also supports this claim, and in fact traffic counts conducted for other Villanova projects since 2004 were also conducted during commuter peak periods. Finally, in an email dated 06-14-12, the Township's traffic engineer specifically requested that the AM and PM peak hours be the hours examined (see **Appendix A**).

The basis of this effort are 'ordinary condition' traffic counts, and these counts were conducted over a period of several days beginning the week of 11-05-12 during which time Villanova was in regular session. In addition to these counts, the Township requested the University conduct additional traffic counts during 2 other 'special event' traffic conditions. These events included Homecoming (10-26-12) and a weekday evening during a basketball game (vs St. Joe's, 12-11-12).

COUNT ADJUSTMENTS

Traffic data collection efforts typically focus on traffic which is processed or 'served' at an intersection. In some cases, however, the traffic 'demand' might be more than what is actually processed at an intersection. When this occurs, it is typically found only at signalized intersections and only in cases where traffic demand is *significantly* greater than intersection capacity. In addition a separate, related phenomenon is called 'initial unmet demand'. This is when a persistent queue of traffic is present at the *beginning* of an analysis period (i.e., the beginning of a peak hour) and also when said queue is not processed adequately at a signalized intersection. Traffic analysis methods and software account for either of these phenomenona to some extent, but if either is excessive, additional measures can be taken to adjust count data.

After the peak hours were determined, FTA revisited the study area in the first week of December 2012 to document additional details regarding the traffic demand vs traffic served issue as well as the initial unmet demands. Summary tables were developed to summarize the following: subject intersection, intersection type, approach, initial unmet demand observations, excessive unmet demand observations, and findings. These tables are included with this appendix. More details behind the purpose and methodology of the investigation are explained under the 'Purpose' heading found on page two of each table (one for each peak hour).

ANALYSIS RESULTS -- 'ORDINARY TRAFFIC'

AM and PM commuter 'system peak' hours were determined using a spreadsheet and the identified peak hours were found to be 7:30 to 8:30 AM and 5:00 to 6:00 PM. Spreadsheets were prepared both for the study area and for the Lancaster Avenue corridor and are attached to the end of this report in the appendix. The spreadsheets are based on vehicular volumes – pedestrian volumes were excluded. The highlighting used in the spreadsheets identifies individual intersection peak hours (in red). Only a handful of non-critical locations had individual peak hours different from the system peak (and typically only shifted by 15 minutes as shown in the tables).

ANALYSIS RESULTS -- 'HOMECOMING TRAFFIC'

In 2012, Homecoming occurred on Saturday, 10-27-12 and – per discussions with the Township – traffic counts were conducted at a reduced study area from 12:00 Noon to 3:00 PM. Spreadsheets were prepared both for the entire study area and for the Lancaster Avenue corridor and are attached to the end of this report in the appendix. The identified peak hours was found to be: 12:00 to 1:00 PM.

Interestingly, the traffic volumes for virtually every traffic *turning movement* in the study area during the peak hour of Homecoming are either comparable to or significantly less than the data that was collected during the weekday AM or weekday PM peak hour. In many cases, *total intersection* volume – such as at Lancaster Avenue and Spring Mill Road / Kenilworth Road / Aldwyn Lane – were also significantly lower than the 'ordinary traffic' counterpart. Realizing all this, there is no value in performing additional LOS calculations, since the LOS outputs of weekday commuter conditions represent a comparable – or worse – peak hour operational conditions. Additionally, level of service calculations are not even possible at intersections which are under manual police control, which was the case at certain key locations in the study area during Homecoming. The township traffic engineer agreed with this conclusion in a letter dated 1 February 2013 though the need for a "Special Event Management Plan" was mentioned (see **Appendix A**).

ANALYSIS RESULTS -- 'BASKETBALL TRAFFIC'

After Homecoming was over, the Township requested Villanova perform additional data collection during a Basketball home game. This traffic is somewhat different from Homecoming since Homecoming occurs on Saturday while a home basketball game occurs during a week night during which time some lingering remaining 'day' student, faculty, and staff may be *leaving* campus while at the same time some 'night' student, faculty, and staff are *arriving* at campus. Per discussions with the Township – traffic counts were conducted using the same study area as Homecoming and from 6:00 to 8:00 PM since the game starts at approximately 7:00 PM. Once again, a 'system peak' hour was determined using a spreadsheet. The identified peak hours was found to be: 6:00 to 7:00 PM.

Coincidentally, as with Homecoming, the traffic volumes for virtually every traffic *turning movement* in the study area during the peak hour of the Basketball game data collection effort are either comparable to or significantly less than the data that was collected during the weekday AM or weekday PM peak hour. In many cases, *total intersection* volume – such as at Lancaster Avenue and Spring Mill Road / Kenilworth Road / Aldwyn Lane – was also significantly lower than the 'ordinary traffic' counterpart. Realizing all this, there is once again no value in performing additional LOS calculations, and once again levels of service calculations at certain key locations are not even possible due to manual police control. The township traffic engineer agreed with this conclusion in a letter dated 1 February 2013 though the need for a "Special Event Management Plan" was mentioned (see **Appendix A**).

Purpose

The purpose of this table is to summarize observations which were made in the first week of December 2012 subsequent to establishing the peak hours of the 'ordinary traffic conditions' scenario. The township engineer requested that traffic volume inputs in the level of service models reflect traffic demand as well as traffic served, so FTA prepared this table to summarize whether the actual counts reflect proper volume inputs for the model or if there is a significantly oversaturated condition in which traffic demands consistently are unmet. In addition a related but slightly different notion -- ***initial*** unmet demand (IUD) -- was also documented per page 18-14 of the HCM 2010 edition. IUD is documented in the first columns of the above table and as shown 3 observations of unserved vehicles ("queues"), if any at the beginning of the subject peak hour were documented and then a determination was made whether to include a non-zero value in the IUD field of the software. ***Excessive*** unmet demand was determined by revisiting the subject intersection during the peak 15-minute period of the peak hour and taking data samples relative to excessive, unserved vehicles ("queues"), if any. If over-saturation appeared sustained for an extended time, it was noted (per the HCM), as were any other anomalies.

Note that, in all cases, only intersections having one or more approaches which were noted as possibly having operational issues by data collectors (during the traffic counts) were actually visited and documented above. Finally, some conclusions are similar in multiple locations, so rather than write the same text repeatedly, a key was prepared (below) and letters were used as appropriate to summarize the respective condition(s) / finding(s) which were observed / determined.

Summary Key

A. *Sustained,* unserved traffic demands are *not* present and so no adjustments were made.
B. LOS F ratings are a function of long cycle length and heavy demand but traffic is generally served in one given cycle (i.e., vehicles typically do not wait for 2nd cycle
C. Peak demands appear to be random, cycle-by-cycle fluctuations which are to be ignored (per HCM2010 18-14).
D. LOS F ratings at this unsignalized location are conservative as it appears the platooning / gap creating effects of adjacent signalized intersections are not reflected.
E. Queues at this unsignalized intersection are a function of an immediately adjacent signalized intersection which has a metering effect on the subject intersection. Queues are therefore not a function of unserved demand / oversaturation but rather other geometric factors unrelated to the subject intersection.

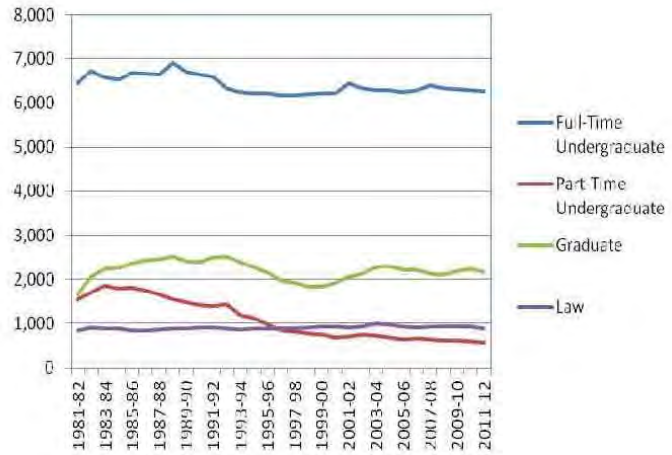
APPENDIX G

Trip Generation

TRIP GENERATION

Trip generation at a university or college is principally a function of the student body. Student population at Villanova has remained consistent and flat for the last 20+ years as depicted in the following chart:



The project is principally aimed at addressing currently-unmet student desires, namely more on-campus housing for existing undergraduate upperclassmen (juniors and seniors). At present there are 1,779 of the 2,982 full-time undergraduate juniors and seniors living off campus[1] and so they currently commute to classes, often during weekday commuter peak periods. Thus, if the project is constructed, the majority of these commuters will be living on campus and as a result peak hour traffic both at site driveways *and* in the study area generally will be reduced as a result of the project.

It should be noted that students who once lived off-campus in rental housing will likely be replaced by new tenants. Those tenants may be students of Villanova (or other institutions) or may not be students at all, but in any event it is unlikely that all the new tenants will be other Villanova students. Even if they are, they will probably be Villanova students who live more remotely, and thus the net impact to the study area and the campus will be the same (i.e., a net reduction in total commuting traffic). Even so, there is no practical way to *remove* peak hour traffic associated with the currently-commuting undergraduate students from the existing counts at the intersections in the study area, and so for this reason future peak hour traffic estimates are doubly conservative – *not only are driveway volumes not adjusted (reduced) to reflect students who will be living on campus but also the intersections in the study area are also not adjusted (reduced) to reflect students who will be living on campus*.

SITE-DERIVED TRIP GENERATION

Traffic counts were not conducted at every driveway to every parking facility on the entire campus nor were students polled to determine mass transit usage, but some measure of site-specific trip generation can still be derived from collected data.

There are 1,783 parking spaces found on the Main Lot, the Pike Lot, and the Visitor's Lot (combined). These spaces represent 34.7% of total parking supply. Determining the traffic activity

[1] Fall 2012 semester data.

(i.e., entering and exiting traffic) of these parking lots and dividing by the parking supply factor (34.7%) will yield approximate campus-wide trip generation activity which can then be compared with the number of students currently attending Villanova (10,127) so that a trip generation rate per student can be derived. This rate can then be compared with ITE rates, as an added back-check.

TRIP GENERATION TRAFFIC COUNTS

Turning Movement (manual) and Automatic Traffic Recorder (ATR) traffic counts were conducted at every driveway serving the Main and Pike Lots in Fall 2011. The trip generation activity gathered from the turning movement counts is summarized in Table 1:

Table 1 – Main Lot + Pike Lot + Visitor Lot Traffic Activity, All Driveways

Source/Date	AM Peak Hour[6]			PM Peak Hour[7]		
	IN	OUT	TOTAL	IN	OUT	TOTAL
09/2011, TM counts	405	50	455	352	404	756

The potential use of this data as a building block for forecasting trip generation arising from the project is a critical element of study and so was validated a few different ways. The focus of the validation effort was placed on the four driveways along Ithan Avenue which, collectively, process the majority of traffic to and from the parking lots.

Table 2 summarizes the gathered traffic count data with the first row being a repeat of the trip generation numbers contained in Table 1 (but as a subset of just Ithan Avenue driveways). Note that an 8th column is introduced in Table 2, namely the sum of AM and PM peak hour total entering/exiting activity. It is this value which can be used as a metric to gauge the validity of the 2011 turning movement data. Note that additional turning movement counts were conducted in 2013 as well, as shown in the table below.

Table 2 – Main Lot + Pike Lot + Visitor Lot Traffic Activity, Ithan Avenue Driveways

Source/Date	AM Peak Hour[2]			PM Peak Hour[3]			AM + PM
	IN	OUT	TOTAL	IN	OUT	TOTAL	TOTAL
09/2011, TM counts (Thursday)	299	7	306	210	236	446	752
02/2013, TM counts (Thursday)	307	13	320	211	220	431	751
10/2011, ATR counts (Thursday)	251	11	262	218	222	440	702
10/2011, ATR counts (Tuesday)	257	17	274	229	213	442	716

Review of the gathered data confirms that the 09/2011 turning movement traffic counts continues to be valid as the basis of trip generation for the project. Raw count data is provided in the appendix of this deliverable.

[2] 7:45-8:45 AM from 2011 turning movement counts (8:00 to 9:00 used for ATR data).

[3] 5:00-6:00 PM from 2011 turning movement counts (same hour used for ATR data).

VILLANOVA TRIP GENERATION vs PUBLISHED TRIP GENERATION

Similar to the parking demand exercise, the gathered traffic counts can be used to generate a University-specific trip generation rate. This rate can be compared with rates published by the Institute of Transportation Engineers (ITE) in its publication, Trip Generation. Trip Generation is a collection of empirical data which has been combined, reviewed, and statistically analyzed to generate parking rates to be used as a guide in planning new facilities. Trip Generation includes dozens of different land use categories including Land Use Code 550: University/College.

To generate a parking demand *rate*, traffic count data must be correlated with a variable. Trip Generation incorporates the use of two variables for University/College land uses, namely "students" and "employees". The student-based dataset is larger and appears to be the more appropriate variable.

As mentioned earlier, the current student population totals 10,127 students. AM peak hour traffic activity totals 455 trips and PM peak hour traffic totals 756 trips (see Table 1). Villanova-specific trip generation rates derived from school population and comparison with ITE's LUC 550 category rates follows in Table 3 and Table 4:

Table 3: Trip Generation Rate Derivation

TIME PERIOD	TOTAL TRIPS	PARKING SUPPLY FACTOR APPLIED	DIVIDED BY STUDENT BODY
AM Peak Hour	455	1311	0.129
PM Peak Hour	756	2179	0.215

Table 4: Trip Generation Rate Comparison

DATA SOURCE	TRIP GENERATION RATE (PER STUDENT)		
	AM Peak Hour	PM Peak Hour	AM + PM Combined
Villanova	0.129	0.215	0.344
ITE	0.170	0.170	0.340

Villanova-specific rates are reasonably well-correlated with ITE data. Note this exercise does not specifically address the influence of mass transit, though whatever patronage of mass transit currently exists is reflected in collected traffic count data. More importantly, this exercise was merely just that – an exercise – since the project does not include any new students and in fact is expected to result in a reduction of class day peak period traffic to and from the site since currently-commuting juniors and seniors will now be living in the new housing of the site. The project does, however, feature an increase in parking spaces and as previously mentioned and agreed, this study examines the potential traffic associated with that increase in parking spaces by applying site-specific trip generation rates (using parking spaces as a variable) to the proposed increase in parking supply (a total net increase of 19 spaces). The trip generation rates to be used are summarized in Tables 5 through 8:

Table 5: Project Trip Generation Rate Derivation

TIME PERIOD	TOTAL TRIPS	PARKING SPACES SERVED	TRIP GENERATION RATE PER SPACE
AM Peak Hour	455	1783	0.255
PM Peak Hour	756	1783	0.424

Table 6 – Trip Generation Directional Split Derivation

09/2011, TM counts	AM Peak Hour			PM Peak Hour

The project affects (i.e., increases or decreases) parking supply (and therefore traffic activity) at the HSB and SAC garages as well as at Pike Lot, Main Lot, and the several small lots west of Church Walk. The main exercise of the study is to reassign associated traffic demands to reflect parking supply increases and decreases with existing turning movement volumes at existing driveways scaled proportionately to the proposed increase or decrease in spaces. Likewise, subsequent downstream/upstream 'feeder' turning movements are also modified proportionately.

TRIP GENERATION – RETAIL SPACE

The project includes approximately 15,000 SF of retail space. The exact users of the space are not yet defined. The CICD ordinance allows "retail subordinate" uses of varying types, including restaurant, clothing store, bookstore, ice cream shop, etc. The majority of patrons of the stores are expected to be Villanova students, faculty, staff, employees, visitors, and related individuals who have already made a trip to or from the campus and thus the retail subordinate trip will be an internalized or captured trip, meaning a trip which is not a new external vehicular trip exclusively made for purposes of visiting the retail establishment. Quantification of "majority of patrons" is appropriate.

ITE TRIP GENERATION

ITE trip generation rates are not appropriate in the context of "retail subordinate" uses since the land use codes contained in Trip Generation Manual are chiefly derived from free-standing establishments which are often considerably larger than the ~3KSF to ~9 KSF building space which may be associated with an individual user in the LAH. More importantly, they are not subordinate to a larger institutional use, such as the case here. The best predictor of possible trip generation activity for the uses at Villanova are other comparable existing uses at other universities in the Delaware Valley.

ST JOE's 54th STREET TRIP GENERATION

In 2004, St. Joe's broke ground on a new parking garage which has a footprint of approximately 20,000 SF and three ground-floor retailers. The project is located along 54th Street, immediately south of City Avenue. Accounting for garage ramps, dumpster locations, common hallways, elevators, staircases, and the garage management office, it appears the three retail uses total about 15,000 SF of leaseable area – similar to the Villanova proposal. In addition, three uses are featured: the St. Joe's Bookstore, a restaurant/bistro, and a Starbucks. The bookstore is the largest tenant and appears to occupy about 8 KSF with the remainder going to the remaining two uses with the restaurant being about twice the size of the Starbucks. The bookstore has a relatively small 'book' component – most (more than 50%) of the floor area is St. Joe's branded apparel and related items and about 25% is a small convenience store having a broad range of products, similar to a small CVS/Wawa hybrid.

Since the exact users and SFage of each of Villanova's site are not yet known, the total existing trip generation and capture rate of St. Joe's is a good predictor of the potential combined sum of retail subordinate activity at Villanova.

St. Joe's traffic activity was polled on several occasions during the weekday AM and PM peak hours defined in the September 2014 TIS (7:30 to 8:30 AM and 5:00 to 6:00 PM). Patrons (people) entering and exiting each storefront were tabulated and a select number of patrons were interviewed to determine if they were St. Joe's students, faculty, staff, or employees. Additionally, the general manager of the bookstore and the restaurant were interviewed. The following table summarizes what was learned.

Table 8 – Retail Interviews and Visitor Counts

(a) Number who answered "yes" to being a St. Joe's student, faculty, staff, or employee.

As shown in the above table, interviews were based on a sample of 30 random patrons on 3 different days and ranged from a low of 76% to a high of 90% of users answering "yes" to being a St. Joe's student, faculty, staff, or employee (i.e., a captured trip). Chris Silenzi, manager of the restaurant, stated that the "St. Joe's" patronage varies with day of the week and as well as with the season, but was also quick to point out that during breaks/summer months, while the St. Joe's patronage percentage decreases, so also does total sales (and, therefore, total traffic). He stated that during most school days the percentage is "probably 80-90%". David Towne, manager of the bookstore stated that he believed "less than 10% of my traffic is from outside the campus community". Based on all this, using an estimate of 75% for 'captured' trips at Villanova seems conservative. Taking the highest data point for each peak hour from the above table and applying a 75% capture credit yield the following estimate of new vehicular based trips which could be generated by the retail space at Villanova:

Table 9 – Net New Vehicular Trips
Retail Subordinate Uses at Villanova (Total)

AM PEAK HOUR			PM PEAK HOUR		
IN	OUT	TOTAL	IN	OUT	TOTAL
11	11	22	34	30	64

Note that the numbers above assume each patron translates to a single-occupant vehicular trip, which is conservative.

Even though the township traffic engineer's July 2014 letter did not explicitly state to include this traffic in the TIS (and even though the PennDOT review letter didn't mention the subject at all), these traffic estimates *were* included in the Projected Conditions of the September 2014 TIS for Villanova's project.

APPENDIX I

Capacity Analyses

CAPACITY ANALYSES

The TIS includes an unusually large number of intersections in the study area, as requested by the Township. Additionally, some intersections are not eligible for HCM 2010 analysis. Some intersections were examined using more than one lane configuration or traffic control treatment. All of these factors combine to create a printed capacity analysis output which is large and difficult to navigate.

Synchro files for the AM and PM peak hours of the five scenarios examined (Existing, 2018 Base, 2018 Projected, 2023 Base, and 2023 Projected) are available upon request and provide an more navigable alternative to inspect the LOS results. When examining level of service results and comparing with Table I, the following must be considered:

For signalized intersections:

- Synchro node numbers 7, 11, and 27 are ineligible for HCM 2010 analysis and the results utilized were based upon Percentile Delay (i.e., *Synchro*) results.
- When examining the impact of adding a EB right-turn lane at the intersection of Lancaster Avenue and Ithan Avenue (node 27), 3 additional seconds must be added to Phase 9 to account for the added crosswalk length (12 feet). The cycle length is held constant and Phase 2+6 is reduced accordingly.

For unsignalized intersections:

- Synchro node numbers 2 and 38 are ineligible for HCM 2010 analysis and the results utilized were based upon Percentile Delay (i.e., *Synchro*) results with overall delay assumed to be a midpoint of the LOS letter grade category determined in the results. Changes in delay estimates, if any, between scenarios were based in part on relative ICU ratio changes.

Other notes:

- Ped calls were observed at the intersection of Lancaster Avenue and Ithan Avenue (node 27) and found to be at least once per cycle (30/hr) but was increased by 50% in the analysis (45 calls) to account for potential added activity and provide a measure of conservativeness.
- Ped calls at the intersection of Lancaster Avenue and Ithan Avenue were kept constant in all five scenarios to add further conservativeness to the analysis. The likely outcome of the project will be to reduce ped activity at the intersection of Lancaster Avenue and Ithan Avenue which in turn should reduce ped calls, but this potential was ignored.

GENERAL NOTES

NO MODIFICATIONS OF THIS INSTALLATION ARE PERMITTED UNLESS PRIOR APPROVAL IS GRANTED IN WRITING BY A REPRESENTATIVE OF THE DEPARTMENT OF TRANSPORTATION.

ALL MAINTENANCE WORK INCLUDING TRIMMING OF TREES, NECESSARY FOR PROPER VISIBILITY OF THE SIGNALS IS THE RESPONSIBILITY OF THE PERMITTEE.

ALL SIGNS AND PAVEMENT MARKINGS INDICATED ON THIS DRAWING ARE CONSIDERED PART OF THE PERMIT AND SHALL BE INSTALLED AND MAINTAINED IN ACCORDANCE WITH PUBLICATION NO. 68.

POST MOUNTED SIGNALS SHALL BE INSTALLED WITH THE SIGNAL HEADS A MINIMUM OF 2 FEET BEHIND THE FACE OF CURB OR THE EDGE OF THE SHOULDER. SUPPORT POLES FOR OVERHEAD SIGNALS SHALL ALSO HAVE A MINIMUM CLEARANCE HORIZONTALLY OF 2 FEET.

SIGNALS ERECTED OVER THE ROADWAY SHALL HAVE A MINIMUM VERTICAL CLEARANCE OF 16 FT. ABOVE THE ROADWAY. POST MOUNTED SIGNALS SHALL BE A MINIMUM OF 8 FT. ABOVE THE SIDEWALK OR PAVEMENT.

ALL OVERHEAD SIGNALS MUST BE RIGIDLY MOUNTED, TOP AND BOTTOM, AND EQUIPPED WITH BACKPLATES.

THE MINIMUM HORIZONTAL DISTANCE BETWEEN SIGNALS MEASURED AT RIGHT ANGLES TO THE APPROACH SHALL BE 8 FEET.

EXACT LOCATION OF DETECTORS SHALL BE DETERMINED PRIOR TO INSTALLATION BY A REPRESENTATIVE OF PENNDOT.

CURBING TO BE INSTALLED BY MUNICIPALITY AND WHERE NOTED, SHALL BE PLAIN CEMENT CONCRETE CURB OR GRANITE CURB, INSTALLED IN ACCORDANCE WITH DEPARTMENT SPECIFICATIONS FORM 408.

PRIOR TO INSTALLATION THE CONTRACTOR SHALL CONSULT WITH THE LOCAL OFFICIALS AND UTILITY COMPANIES TO RESOLVE ANY PROBLEMS WHICH MAY BE CREATED DUE TO THE LOCATION OF UTILITIES.

THIS DRAWING CANNOT BE USED AS A CONSTRUCTION DRAWING UNLESS THE PERMITTEE COMPLIES WITH THE PROVISIONS OF ACT 187, PREVENTION OF DAMAGE TO UNDERGROUND UTILITIES, EFFECTIVE DATE DECEMBER 19, 1996.

WHEN LIQUID FUELS MONEY IS USED, SIGNAL INSTALLATION MUST CONFORM TO FORM 408 AND A COPY OF THE PROPOSED SPECIFICATIONS MUST BE SUBMITTED TO THE DISTRICT TRAFFIC UNIT, FOR REVIEW, PRIOR TO BIDDING.

PERMITTEE SHALL OBTAIN A HIGHWAY OCCUPANCY PERMIT FOR ANY CHANGES IN INTERSECTION GEOMETRY REGARDING EXCAVATION.

CONDUIT INSTALLED IN BITUMINOUS ROADWAY LESS THAN 5 YEARS OLD, OR CONCRETE ROADWAY REGARDLESS OF AGE, MUST BE BORED OR JACKED UNDER THE ROADWAY. INSTALL IN ACCORDANCE WITH TRAFFIC SIGNAL STANDARDS TC-7800 SERIES.

EMERGENCY PRE-EMPTION NOTES:

- CONTROLLER TO BE EQUIPPED WITH EMERGENCY PRE-EMPTION FOR THE NORTHBOUND AND SOUTHBOUND APPROACHES OF ITHAN AVENUE AND THE EASTBOUND & WESTBOUND APPROACHES OF CONESTOGA ROAD WITH FAIL SAFE DEVICE FOR EACH DIRECTION OF OPERATION.
  THIS EMERGENCY BEACON SHALL CONSIST OF A FLASHING WHITE FLOOD LIGHT, AND SHALL FLASH WHEN THE EMERGENCY VEHICLE HAS CONTROL OF THE INTERSECTION FOR THE APPROPRIATE APPROACH.
  LOCATION OF EMERGENCY VEHICLE DETECTORS ARE TO BE FIELD ADJUSTED TO ACHIEVE MAXIMUM OPERATION.
- THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, SHALL TERMINATE ALL GREEN INDICATIONS IMMEDIATELY FOLLOWED BY THE COMPLETE YELLOW AND RED CLEARANCE INTERVALS, ACCORDINGLY. THEN THE GREEN INTERVAL FOR THE PRE-EMPTED PHASE SHALL FOLLOW.
- THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, SHALL TIME OUT ALL YELLOW AND RED INDICATIONS, FOLLOWED BY THE GREEN INTERVAL OF THE PRE-EMPTION PHASE GOVERNED BY THE APPROACHING EMERGENCY VEHICLE.
- IF SIGNALS HAVE BEEN ACTUATED BY PEDESTRIAN PUSH BUTTON, AND THE SIGNAL IS PRE-EMPTED, THE PEDESTRIAN TIME SHALL BE SPLIT BETWEEN "PED WALK" AND "PED CLEAR". THE "PED WALK" INTERVAL SHALL TERMINATE IMMEDIATELY FOLLOWED BY THE "PED CLEAR" INTERVAL. THIS INTERVAL SHALL TIME OUT FOLLOWED BY THE APPROPIATE SELECTIVE CLEARANCES BEFORE PROCEDING TO THE PRE-EMPTION PHASE.
- IF THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, ARE FLASHING ALL SIGNALS SHALL REMAIN FLASHING.
- IF ADDITIONAL PRE-EMPTION PHASES ARE ACTIVATED WHILE IN PRE-EMPTION, THE ORIGINAL PRE-EMPTION PHASE SHALL TIME OUT BEFORE PROCEEDING TO THE NEXT PRE-EMPTION PHASE.
- UPON COMPLETION OF PRE-EMPTION, PHASE 2,4,6 OR 8 IN RETURNING TO NORMAL OPERATION, PHASE 2+6 INTERVAL 1 SHALL FOLLOW.
- IN EMERGENCY PRE-EMPTION, NO PRIORITY SHALL BE ESTABLISHED, PRE-EMPTION SHALL BE A "FIRST COME, FIRST SERVE" OPERATION.

- INLET

GENERAL NOTES

NO MODIFICATIONS OF THIS INSTALLATION ARE PERMITTED UNLESS PRIOR APPROVAL IS GRANTED IN WRITING BY A REPRESENTATIVE OF THE DEPARTMENT OF TRANSPORTATION.

ALL MAINTENANCE WORK INCLUDING TRIMMING OF TREES, NECESSARY FOR PROPER VISIBILITY OF THE SIGNALS IS THE RESPONSIBILITY OF THE PERMITTEE.

ALL SIGNS AND PAVEMENT MARKINGS INDICATED ON THIS DRAWING ARE CONSIDERED PART OF THE PERMIT AND SHALL BE INSTALLED AND MAINTAINED IN ACCORDANCE WITH PUBLICATION NO. 212.

POST MOUNTED SIGNALS SHALL BE INSTALLED WITH THE SIGNAL HEADS A MINIMUM OF 2 FEET BEHIND THE FACE OF CURB OR THE EDGE OF THE SHOULDER. SUPPORT POLES FOR OVERHEAD SIGNALS SHALL ALSO HAVE A MINIMUM CLEARANCE HORIZONTALLY OF 2 FEET.

SIGNALS ERECTED OVER THE ROADWAY SHALL HAVE A MINIMUM VERTICAL CLEARANCE OF 16 FT. ABOVE THE ROADWAY. POST MOUNTED SIGNALS SHALL BE A MINIMUM OF 8 FT. ABOVE THE SIDEWALK OR PAVEMENT.

ALL OVERHEAD SIGNALS MUST BE RIGIDLY MOUNTED, TOP AND BOTTOM, AND EQUIPPED WITH BACKPLATES.

THE MINIMUM HORIZONTAL DISTANCE BETWEEN SIGNALS MEASURED AT RIGHT ANGLES TO THE APPROACH SHALL BE 5 FEET.

EXACT LOCATION OF DETECTORS SHALL BE DETERMINED PRIOR TO INSTALLATION BY A REPRESENTATIVE OF PENNDOT.

CURBING TO BE INSTALLED BY MUNICIPALITY AND WHERE NOTED, SHALL BE PLAIN CEMENT CONCRETE CURB OR GRANITE CURB, INSTALLED IN ACCORDANCE WITH DEPARTMENT SPECIFICATIONS FORM 408.

PRIOR TO INSTALLATION THE CONTRACTOR SHALL CONSULT WITH THE LOCAL OFFICIALS AND UTILITY COMPANIES TO RESOLVE ANY PROBLEMS WHICH MAY BE CREATED DUE TO THE LOCATION OF UTILITIES.

THIS DRAWING CANNOT BE USED AS A CONSTRUCTION DRAWING UNLESS THE PERMITTEE COMPLIES WITH THE PROVISIONS OF THE LATEST AMENDMENT TO ACT 287, PREVENTION OF DAMAGE TO UNDERGROUND UTILITIES, DATED DECEMBER 20, 1974.

WHEN LIQUID FUELS MONEY IS USED, SIGNAL INSTALLATION MUST CONFORM TO FORM 408 AND A COPY OF THE PROPOSED SPECIFICATIONS MUST BE SUBMITTED TO THE DISTRICT TRAFFIC UNIT, FOR REVIEW, PRIOR TO BIDDING.

PERMITTEE SHALL OBTAIN A HIGHWAY OCCUPANCY PERMIT FOR ANY CHANGES IN INTERSECTION GEOMETRY REGARDING EXCAVATION.

CONDUIT INSTALLED IN BITUMINOUS ROADWAY LESS THAN 5 YEARS OLD, OR CONCRETE ROADWAY REGARDLESS OF AGE, MUST BE BORED OR JACKED UNDER THE ROADWAY. INSTALL IN ACCORDANCE WITH TRAFFIC SIGNAL STANDARDS TC-8800 SERIES.

ⓑ G WHEN RETURNING TO NORMAL OPERATION

EMERGENCY PRE-EMPTION NOTES:

- CONTROLLER TO BE EQUIPPED WITH EMERGENCY PRE-EMPTION FOR THE NORTHBOUND & SOUTHBOUND APPROACHES OF SPROUL ROAD AND THE EASTBOUND & WESTBOUND APPROACHES OF LANCASTER AVENUE WITH A FAIL SAFE DEVICE FOR EACH DIRECTION OF OPERATION.
  THIS EMERGENCY BEACON SHALL CONSIST OF A FLASHING WHITE FLOOD LIGHT, AND SHALL FLASH WHEN THE EMERGENCY VEHICLE HAS CONTROL OF THE INTERSECTION FOR THE APPROPRIATE APPROACH.
- THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, SHALL TERMINATE ALL GREEN INDICATIONS IMMEDIATELY, FOLLOWED BY THE COMPLETE YELLOW AND RED CLEARANCE INTERVALS, ACCORDINGLY. THEN THE GREEN INTERVAL FOR THE PRE-EMPTED PHASE SHALL FOLLOW.
- THE SIGNALS, WHEN ACTIVATED BY EMERGENCY VEHICLE, SHALL TIME OUT ALL YELLOW AND RED INDICATIONS, FOLLOWED BY THE GREEN INTERVAL OF THE PRE-EMPTION PHASE GOVERNED BY THE APPROACHING EMERGENCY VEHICLE.
- IF SIGNALS HAVE BEEN ACTUATED BY PEDESTRIAN PUSH BUTTON AND THE SIGNAL IS PRE-EMPTED DURING THE "MAN" INTERVAL, THE "MAN" INTERVAL SHALL TERMINATE IMMEDIATELY FOLLOWED BY THE "FLASHING HAND" INDICATION IN ITS ENTIRETY, FOLLOWED BY THE APPROPRIATE SELECTIVE CLEARANCES BEFORE PROCEEDING INTO THE PRE-EMPTION PHASE.
- IF THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, ARE FLASHING, ALL SIGNALS SHALL REMAIN FLASHING.
- IF ADDITIONAL PRE-EMPTION PHASES ARE ACTIVATED WHILE IN PRE-EMPTION, THE ORIGINAL PRE-EMPTION PHASE SHALL TIME OUT BEFORE PROCEEDING TO THE NEXT PRE-EMPTION PHASE.
- UPON COMPLETION OF PRE-EMPTION, PHASE 2,4,6 OR 8 IN RETURNING TO NORMAL OPERATION, PHASE 2+6 INTERVAL 4 SHALL FOLLOW.
- IN EMERGENCY PRE-EMPTION, NO PRIORITY SHALL BE ESTABLISHED, PRE-EMPTION SHALL BE A "FIRST COME, FIRST SERVE" OPERATION.

EMERGENCY PRE–EMPTION NOTES:

- CONTROLLER TO BE EQUIPPED WITH EMERGENCY PRE–EMPTION FOR THE EASTBOUND & WESTBOUND APPROACHES OF LANCASTER AVENUE (S.R. 0030), AND THE NORTHBOUND & SOUTHBOUND APPROACHES OF ITHAN AVENUE, WITH A FLASHING FAIL SAFE DEVICE FOR EACH DIRECTION OF OPERATION.

  THIS FAIL SAFE DEVICE SHALL CONSIST OF A FLASHING WHITE FLOOD LIGHT, AND SHALL BEGIN FLASHING WHEN THE PREEMPTION PHASE DISPLAYS PREEMPTION GREEN FOR THE EMERGENCY VEHICLE APPROACH.
- THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, SHALL TERMINATE ALL GREEN INDICATIONS EXCEPT THE GREEN INDICATIONS FOR THE PHASE GOVERNED BY THE APPROACHING EMERGENCY VEHICLE, FOLLOWED BY SELECTIVE CLEARANCES DEPENDENT UPON THE PHASE IN WHICH THE PRE–EMPTION OCCURS. THE GREEN INDICATIONS FOR THE PRE–EMPTED PHASE SHALL REMAIN GREEN FOR THE DURATION OF SIGNAL PRE–EMPTION WITH RED INDICATIONS DISPLAYED FOR ALL OTHER PHASES.
- THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, SHALL TIME OUT ALL YELLOW AND RED INDICATIONS FOLLOWED BY THE GREEN INTERVAL OF THE PRE–EMPTION PHASE GOVERNED BY THE ACTUATION OF THE APPROACHING EMERGENCY VEHICLE.
- IF THE SIGNALS ARE FLASHING WHEN ACTIVATED BY AN EMERGENCY VEHICLE ALL SIGNALS SHALL REMAIN FLASHING.
- UPON COMPLETION OF PRE–EMPTION PHASE 2, 4, 6 OR 8, IN RETURNING TO NORMAL OPERATION PHASE 2+6 INTERVAL 10 SHALL FOLLOW.
- IF ADDITIONAL PRE–EMPTION PHASES ARE ACTIVATED WHILE IN PRE–EMPTION, THE ORIGINAL PRE–EMPTION PHASE SHALL TIME OUT BEFORE PROCEEDING TO THE NEXT PRE–EMPTION PHASE.
- IN EMERGENCY PRE–EMPTION, NO PRIORITY SHALL BE ESTABLISHED, PRE–EMPTION SHALL BE A "FIRST COME, FIRST SERVE" OPERATION.
- THE FIELD LOCATIONS OF THE PREEMPTION DETECTORS MAY DIFFER FROM THE LOCATIONS DEPICTED ON THE CONDITION DIAGRAM, AS THE DETECTORS MAY NEED TO BE RELOCATED AND/OR ADJUSTED TO PROVIDE ACCEPTABLE OPERATION AS DEEMED APPROPRIATE BY DEPARTMENT PERSONNEL.
- IF THE SIGNAL HAS BEEN ACTUATED BY A PEDESTRIAN PUSH BUTTON, AND THE SIGNAL IS PRE–EMPTED DURING THE "MAN" PHASE, THE "MAN" PHASE SHALL TERMINATE IMMEDIATELY, FOLLOWED BY THE "FLASHING HAND" INDICATION IN ITS ENTIRETY, FOLLOWED BY THE APPROPRIATE SELECTIVE CLEARANCES BEFORE PROCEEDING TO THE PRE–EMPTION PHASE.

EMERGENCY PRE-EMPTION NOTES:

- CONTROLLER TO BE EQUIPPED WITH EMERGENCY PRE-EMPTION FOR THE NORTHBOUND & SOUTHBOUND APPROACHES OF ITHAN AVENUE AND THE EASTBOUND & WESTBOUND APPROACHES OF LANCASTER AVENUE WITH A FAIL SAFE DEVICE FOR EACH DIRECTION OF OPERATION.
  THIS EMERGENCY BEACON SHALL CONSIST OF A FLASHING WHITE FLOOD LIGHT, AND SHALL FLASH WHEN THE EMERGENCY VEHICLE HAS CONTROL OF THE INTERSECTION FOR THE APPROPRIATE APPROACH.
- THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, SHALL TERMINATE ALL GREEN INDICATIONS IMMEDIATELY, FOLLOWED BY THE COMPLETE YELLOW AND RED CLEARANCE INTERVALS. ACCORDINGLY. THEN THE GREEN INTERVAL FOR THE PRE-EMPTED PHASE SHALL FOLLOW.
- THE SIGNALS, WHEN ACTIVATED BY EMERGENCY VEHICLE, SHALL TIME OUT ALL YELLOW AND RED INDICATIONS, FOLLOWED BY THE GREEN INTERVAL OF THE PRE-EMPTION PHASE GOVERNED BY THE APPROACHING EMERGENCY VEHICLE.
- IF SIGNALS HAVE BEEN ACTUATED BY PEDESTRIAN PUSH BUTTON AND THE SIGNAL IS PRE-EMPTED DURING THE "MAN" INTERVAL, THE "MAN" INTERVAL SHALL TERMINATE IMMEDIATELY FOLLOWED BY THE "FLASHING HAND" INDICATION IN ITS ENTIRETY, FOLLOWED BY THE APPROPRIATE SELECTIVE CLEARANCES BEFORE PROCEEDING INTO THE PRE-EMPTION PHASE.
- IF THE SIGNALS, WHEN ACTIVATED BY AN EMERGENCY VEHICLE, ARE FLASHING, ALL SIGNALS SHALL REMAIN FLASHING.
- IF ADDITIONAL PRE-EMPTION PHASES ARE ACTIVATED WHILE IN PRE-EMPTION, THE ORIGINAL PRE-EMPTION PHASE SHALL TIME OUT BEFORE PROCEEDING TO THE NEXT PRE-EMPTION PHASE.
- UPON COMPLETION OF PRE-EMPTION, PHASE 2,4,6 OR 8 IN RETURNING TO NORMAL OPERATION, PHASE 2+6 INTERVAL 10 SHALL FOLLOW.
- IN EMERGENCY PRE-EMPTION, NO PRIORITY SHALL BE ESTABLISHED. PRE-EMPTION SHALL BE A "FIRST COME, FIRST SERVE" OPERATION.

GENERAL NOTES

NO MODIFICATIONS OF THIS INSTALLATION ARE PERMITTED UNLESS PRIOR APPROVAL IS GRANTED IN WRITING BY A REPRESENTATIVE OF THE DEPARTMENT OF TRANSPORTATION.

ALL MAINTENANCE WORK INCLUDING TRIMMING OF TREES, NECESSARY FOR PROPER VISIBILITY OF THE SIGNALS IS THE RESPONSIBILITY OF THE PERMITTEE.

ALL SIGNS AND PAVEMENT MARKINGS INDICATED ON THIS DRAWING ARE CONSIDERED PART OF THE PERMIT AND SHALL BE INSTALLED AND MAINTAINED IN ACCORDANCE WITH PUBLICATION NO. 212.

POST MOUNTED SIGNALS SHALL BE INSTALLED WITH THE SIGNAL HEADS A MINIMUM OF 2 FEET BEHIND THE FACE OF CURB OR THE EDGE OF THE SHOULDER. SUPPORT POLES FOR OVERHEAD SIGNALS SHALL ALSO HAVE A MINIMUM CLEARANCE HORIZONTALLY OF 2 FEET.

SIGNALS ERECTED OVER THE ROADWAY SHALL HAVE A MINIMUM VERTICAL CLEARANCE OF 16 FT. ABOVE THE ROADWAY. POST MOUNTED SIGNALS SHALL BE A MINIMUM OF 8 FT. ABOVE THE SIDEWALK OR PAVEMENT.

ALL OVERHEAD SIGNALS MUST BE RIGIDLY MOUNTED, TOP AND BOTTOM, AND EQUIPPED WITH BACKPLATES.

THE MINIMUM HORIZONTAL DISTANCE BETWEEN SIGNALS MEASURED AT RIGHT ANGLES TO THE APPROACH SHALL BE 8 FEET.

EXACT LOCATION OF DETECTORS SHALL BE DETERMINED PRIOR TO INSTALLATION BY A REPRESENTATIVE OF PENNDOT.

CURBING TO BE INSTALLED BY MUNICIPALITY AND WHERE NOTED, SHALL BE PLAIN CEMENT CONCRETE CURB OR GRANITE CURB, INSTALLED IN ACCORDANCE WITH DEPARTMENT SPECIFICATIONS FORM 408.

PRIOR TO INSTALLATION THE CONTRACTOR SHALL CONSULT WITH THE LOCAL OFFICIALS AND UTILITY COMPANIES TO RESOLVE ANY PROBLEMS WHICH MAY BE CREATED DUE TO THE LOCATION OF UTILITIES.

THIS DRAWING CANNOT BE USED AS A CONSTRUCTION DRAWING UNLESS THE PERMITTEE COMPLIES WITH THE PROVISIONS OF THE LATEST AMENDMENT TO ACT 287, PREVENTION OF DAMAGE TO UNDERGROUND UTILITIES, DATED DECEMBER 20, 1974.

WHEN LIQUID FUELS MONEY IS USED, SIGNAL INSTALLATION MUST CONFORM TO FORM 408 AND A COPY OF THE PROPOSED SPECIFICATIONS MUST BE SUBMITTED TO THE DISTRICT TRAFFIC UNIT, FOR REVIEW, PRIOR TO BIDDING.

PERMITTEE SHALL OBTAIN A HIGHWAY OCCUPANCY PERMIT FOR ANY CHANGES IN INTERSECTION GEOMETRY REGARDING EXCAVATION.

CONDUIT INSTALLED IN BITUMINOUS ROADWAY LESS THAN 5 YEARS OLD, OR CONCRETE ROADWAY REGARDLESS OF AGE, MUST BE BORED OR JACKED UNDER THE ROADWAY. INSTALL IN ACCORDANCE WITH TRAFFIC SIGNAL STANDARDS TC-8800 SERIES.

GENERAL NOTES

NO MODIFICATIONS OF THIS INSTALLATION ARE PERMITTED UNLESS PRIOR APPROVAL IS GRANTED IN WRITING BY A REPRESENTATIVE OF THE DEPARTMENT OF TRANSPORTATION.

REFER TO TRAFFIC SIGNAL PERMIT DRAWING FOR INDIVIDUAL INTERSECTION OPERATION, GEOMETRY, PHASING AND CRITICAL TIMES.

FOR CONSTRUCTION AND INSPECTION THE SYSTEM PERMIT SHOULD ALWAYS BE ACCOMPANIED WITH TRAFFIC SIGNAL PERMIT DRAWING.

TEST THE SYSTEM AT LOCAL INTERSECTION LEVEL, SUBSYSTEM LEVEL MASTER CONTROLLER LEVEL AND PERSONAL COMPUTER REMOTE DIAL UP LEVEL.

GATHER THE SYSTEM FAILURE CRITICAL ALARMS REPORT AND ARCHIVE THEM WHERE APPLICABLE.

SET UP PENNDOT DISTRICT 6-0 COMPUTER WITH THE SYSTEM DATABASE AND GRAPHICS. MODIFY THE DATABASE AND GRAPHICS FOR SYSTEMS REVISIONS.

ASSIGN LOOP DETECTORS AND PROGRAM THE CONTROLLERS TO GATHER TRAFFIC VOLUMES IN 15 MINUTE INTERVAL, WHERE APPLICABLE.

EXACT LOCATION OF DETECTORS SHALL BE DETERMINED PRIOR TO INSTALLATION BY A REPRESENTATIVE OF PENNDOT.

OBTAIN POLE ATTACHMENT PERMIT FOR AERIAL FIBER OPTIC INSTALLATION.

MAINTAIN MASTER CONTROLLER COMMUNICATION SUCH AS PHONE DROPS.

PRIOR TO INSTALLATION THE CONTRACTOR SHALL CONSULT WITH THE LOCAL OFFICIALS AND UTILITY COMPANIES TO RESOLVE ANY PROBLEMS WHICH MAY BE CREATED DUE TO THE LOCATION OF UTILITIES.

THIS DRAWING CANNOT BE USED AS A CONSTRUCTION DRAWING UNLESS THE PERMITTEE COMPLIES WITH THE PROVISIONS OF THE LATEST AMENDMENT TO ACT 287, PREVENTION OF DAMAGE TO UNDERGROUND UTILITIES, DATED DECEMBER 20, 1974.

WHEN LIQUID FUELS MONEY IS USED, SIGNAL INSTALLATION MUST CONFORM TO FORM 408 AND A COPY OF THE PROPOSED SPECIFICATIONS MUST BE SUBMITTED TO THE DISTRICT TRAFFIC UNIT FOR REVIEW PRIOR TO BIDDING.

PERMITTEE SHALL OBTAIN A HIGHWAY OCCUPANCY PERMIT FOR ANY CHANGES IN INTERSECTION GEOMETRY REGARDING EXCAVATION.

CONDUIT INSTALLED IN BITUMINOUS ROADWAY LESS THAN 5 YEARS OLD, OR CONCRETE ROADWAY REGARDLESS OF AGE, MUST BE BORED OR JACKED UNDER THE ROADWAY. INSTALL IN ACCORDANCE WITH TRAFFIC SIGNAL STANDARDS TC-8800 SERIES.

GENERAL NOTES

NO MODIFICATIONS OF THIS INSTALLATION ARE PERMITTED UNLESS PRIOR APPROVAL IS GRANTED IN WRITING BY A REPRESENTATIVE OF THE DEPARTMENT OF TRANSPORTATION.

ALL MAINTENANCE WORK INCLUDING TRIMMING TREES, NECESSARY FOR PROPER VISIBILITY OF THE SIGNALS IS THE RESPONSIBILITY OF THE PERMITTEE.

ALL SIGNS AND PAVEMENT MARKINGS INDICATED ON THIS DRAWING ARE CONSIDERED PART OF THE PERMIT AND SHALL BE INSTALLED AND MAINTAINED IN ACCORDANCE WITH PUBLICATION N° 68.

POST MOUNTED SIGNALS SHALL BE INSTALLED WITH THE SIGNAL HEADS A MINIMUM OF 2 FEET BEHIND THE FACE OF CURB OR THE EDGE OF THE SHOULDER. SUPPORT POLES FOR OVERHEAD SIGNALS SHALL ALSO HAVE A MINIMUM CLEARANCE HORIZONTALLY OF 2 FEET.

SIGNALS ERECTED OVER THE ROADWAY SHALL HAVE A MINIMUM VERTICAL CLEARANCE OF 16 FT ABOVE THE ROADWAY. POST MOUNTED SIGNALS SHALL BE A MINIMUM OF 8 FT. ABOVE THE SIDEWALK OR PAVEMENT GRADE.

ALL OVERHEAD SIGNALS MUST BE RIGIDLY MOUNTED, TOP AND BOTTOM, AND EQUIPPED WITH BACKPLATES.

THE MINIMUM HORIZONTAL DISTANCE BETWEEN SIGNALS MEASURED AT RIGHT ANGLES TO THE APPROACH SHALL BE 8 FEET.

EXACT LOCATION OF DETECTORS SHALL BE DETERMINED PRIOR TO INSTALLATION BY A REPRESENTATIVE OF PENNDOT.

CURBING TO BE INSTALLED BY MUNICIPALITY WHERE NOTED, SHALL BE PLAIN CEMENT CONCRETE CURB OR GRANITE CURB, INSTALLED IN ACCORDANCE WITH DEPARTMENT SPECIFICATIONS FORM 408.

PRIOR TO INSTALLATION THE CONTRACTOR SHALL CONSULT WITH THE LOCAL OFFICIALS AND UTILITY COMPANIES TO RESOLVE ANY PROBLEMS WHICH MAY BE CREATED DUE TO THE LOCATION OF UTILITIES.

IN ADDITION TO THIS SIGNAL PERMIT THE PERMITTEE SHALL OBTAIN A HIGHWAY OCCUPANCY PERMIT PRIOR TO ANY OPENINGS BEING MADE IN OR UNDER ANY PORTION OF A STATE HIGHWAY.

THIS DRAWING CANNOT BE USED AS A CONSTRUCTION DRAWING UNLESS THE PERMITTEE COMPLIES WITH THE PROVISIONS OF ACT 287, PREVENTION OF DAMAGE TO UNDERGROUND UTILITIES, EFFECTIVE DATE APRIL 10, 1975.

WHEN LIQUID FUELS MONEY IS USED, SIGNAL INSTALLATION MUST CONFORM TO FORM 40 AND A COPY OF THE PROPOSED SPECIFICATIONS MUST BE SUBMITTED TO THE DISTRICT TRAFFIC UNIT, FOR REVIEW, PRIOR TO BIDDING.

TURN LANE WARRANT ANALYSIS

The project includes providing new auxiliary left- and right-turn lanes along Route 30 and Ithan Avenue. There are, however, certain locations where either left-or right-turn auxiliary lanes are *not* suggested. In one case this is because of a suggested prohibition:

- Route 30 WLL driveway, no WB left turn lane is suggested since the movement is prohibited.

In other cases it is because the lanes are not warranted:

- Route 30 PAC driveway, no EB right turn lane is suggested since it is not warranted.
- Ithan Ave LAH/Garage driveways, no NB/SB right turn lanes are suggested since they are not warranted.

Thus the turn lane warrant analysis focuses on the three instances mentioned directly above, to demonstrate the lack of need. Such evidence is provided on the following pages and is based on SOL 470-08-4 as well as PennDOT *Publication 46* Chapter 11 page 11-46 Turn Lane Warrants.

Note that the Queue Analysis (based on Synchro results) demonstrates adequate storage lengths for the site access auxiliary lanes and other key locations. Even so, an alternative to predicting necessary auxiliary lane storage length is provided in SOL 470-08-4, and this analysis is also provided. Note that using Chapter 11 guidelines, the site is Level terrain (truck adjustment factor) and is Traffic Control Condition "A" (using either posted speed limits of 25 mph or a design speed of 35 mph). To simplify calculations and add conservative measure, a Pt value of 10% was used which results in a T factor of 1.05 to be applied to subject volumes (2023 Projected Condition scenario volumes). The following table summarizes SOL 470-08-4 storage need predictions and compares with that which is provided.

DWY	DIR	CYC/HR	ADJ'D SUBJ VOL (AM/PM)	AVG VEH/CYC	SUG'D EXH 11-8 LENGTH (FT)	PROVIDED LENGTH (STOR+TAP)	OK?
WLL	EB R	60	34 / 29	1 / 1	75	125+75	OK
CW	EB R	60	35 / 39	1 / 1	75	125+75	OK
	WB L	60	32 / 27	1 / 1	75	100+75	OK
PAC	WB L	60	66 / 71	1 / 1	75	100+75	OK
LAH/GAR	NB L	60	5 / 4	<1 /< 1	75	50+50	OK (W/ TAPER)
	SB L	60	158 / 143	2 / 2	100	100+75	OK

Recall that the entire Projected Condition analysis of the TIS is based on **ALL** parking spaces treated as peak-hour moving traffic.

Upon further review of Public Safety data, it is unclear if certain '0' entries for Main Lot observations (conducted on 11/6/12, 10/4/2011, and 11/1/12) are in fact times when the Main Lot was 100% full or if the lots simply were not surveyed due to time constraints, calls, or other factors. This spreadsheet incorporates the '0' entries thereby giving the most conservative (i.e., highest demand) interpretation of the data.

Parking Demand Summary Spreadsheet - Basketball Events

West Campus Parking Turnover Investigation

This spreadsheet provides data regarding traffic counts as well as a table summarizing a sample of 30 vehicles which were randomly selected throughout the West Campus (WC) on-street parking areas and parking lots surrounding the resident housing (vehicles displaying West Campus Resident parking permits). The 30 vehicles were evenly spaced throughout the parking areas to achieve a broad sample. The traffic counts were conducted at the gate house which is the only point of vehicular entry to the campus for WC student residents.

The traffic counts and parked vehicle survey were conducted on Tuesday, 30 April 2013 which was a regular school day for Villanova's campus. The counts were conducted midday as requested by the township traffic engineer. Data collection began at 10:00 AM and ended at 12:00 PM. Although all vehicles entering and exiting were counted at the gate house, only those displaying WR hang tags (West Campus Resident Students) were counted and are shown in the summary of count activity table below. Note the peak hour of the traffic counts was 11:00 AM to 12:00 PM.

The purpose of the study was to investigate parking turnover and so the vehicle survey included documenting license plate prefixes (i.e., the first three characters of a vehicle's license plate) and state (if other than PA) and then monitoring the parknig space associated with each individual vehicle over the two-hour count period to see if there was turnover of the space as requested by the township. A key next to the table explains how this was documented. A summary below the key tabulates the turnover activity. A summary below the table provides data from the traffic counts near the gate house. More information (raw data) from the counts are provided on the next page.

KEY

1) If vehicle did not move during the count period, cell was left blank. 2) If vehicle left and no vehicle arrived to occupy the vacant space "***V***", is shown. 3) If vehicle left and a different vehicle arrived and occupied the vacant space, the new vehicle's prefix was entered.

SUMMARY

During the peak hour (11:00 - 12:00), there were 2 exiting vehicles and 2 arriving vehicles
